ACKNOWLEDGEMENTS

I first want to thank my thesis supervisor Prof. Dr. Özer ERTUNA, who has taught me finance, for his valuable assistance, continuous support, and insightful suggestions. I owe him much, because my MBA would be incomplete without his contributions.

I am pleased to acknowledge the assistances of financial analyst Cihangir Samin, and Bilal Kaya from ISO. My last thanks go to the computer engineering department, in which I have been a research assistant, for their understanding attitude during my graduate study and this work.

ABSTRACT

This study analyses the trends in the profitabilities of Turkish private firms in the restructuring period. Financial statements of 47 firms from 9 industries for the years 1981-84 were used for investigation.

Overall and operating profitabilities, return on equity and some ratios related with financial costs were studied and the relation between profitability and interest expense margin was analysed. Macro economic environments and policies and their effects were also surveyed briefly.

ÖZET

Bu çalışma yapı değişikliği sürecinde özel Türk firmalarının karlılıklarındaki değişimleri incelemektedir. Araştırma için 9 endüstriden 47 firmanın 1981 ve 1984 yılları arasındaki mali tabloları kullanılmıştır.

Genel ve çalışma karlılıkları, öz sermayeye dönüş ve mali masraflarla ilgili oranlar incelenmiş ve karlılık ile faiz masraf marjı arasındaki ilişki analiz edilmiştir. Ayrıca genel ekonomik durum ve politikalar ve bunların etkileri de gözden geçirilmiştir.

CHAPTER ONE

I N T R O D U C T I O N

This study analyses the trends in profitabilities and other related subjects of Turkish private firms during the restructuring period. Detailed balance sheets and income statements of 47 firms from 9 industries, which have 1984 sales volumes of one billion TL (US\$ 2.25 million) or more, are used for investigation during the period 1981-1984.

A firm can not live long if it is not profitable. So profitability is examined closely not only by management or owners but also by outsiders. Many studies have been made in this important subject, but most of them have not used individual firm data, instead industrial or even general totals seemed sufficient to researchers. We do not know the percentages of firms which obey the average trends in Turkish economy, the distributions around the means, or whether some firms cancel each other's effects in an analysis which uses totals. So in our study we have taken firms as our basis, and made statistical calculations to identify the distribution patterns and the deviations from the means. In many cases averages, whether simple or weighted, are not statistically reliable, then the distributions of data gain more importance.

For any financial analysis one must use at least a balance sheet and an income statement of the firm under investigation. Although collections of these financial statements are available in most developed countries, this is not the case in Turkey. One of the aims of this study is to form a financial statements data base, which can be also used in other works, in computer media. Gathering data, reformatting them, making the necessary corrections or adjustments, entering the information to the computer and controlling them took more than half of our time in this study. Before the completion of our work, we have encountered some requests to use the stored financial data. This shows the demand in this area in Turkey. A financial analysis computer program which uses the firm information on the diskette is prepared to obtain the results in our study, it can also be used in further analyses.

World economy affects Turkish economy and Turkish economy influences the firms operating in it. Our study begins with a survey of world and Turkish economies for the years 1981-84.

Considering the economic environments, our prior expectations in the restructuring period are explained in Chapter 3.

Data used chapter discusses the significance of the firms analysed in Turkish economy. Comments on previous works are included in that part. We have used the same industries proposed by Istanbul Chamber of Industry (ISO).

Although we have firms from 9 industries, we have not enough sample data for some of them. Industrial significance problem is also examined in Chapter 4.

Fifth chapter forms the theoretical background of the study. Brief information about financial ratio analysis is given, and the used ratios are explained in detail.

Our analysis was carried out under 5 subsections : Overall profitability, operating profitability, return on equity, ratios related with financial costs, and the relation between profitability and interest expense margin.

The results of 12 financial ratio analyses and other statistical computations are interpreted in the results chapter. Individual firm ratios for 4 years are the basis of our analysis. Simple and weighted averages as well as standard deviations are presented in Total Ratio Analysis section. Averages for 6 industries appear in Industrial Ratio Analysis section. Ratio Trend Analysis section is used to identify the trends of individual firms.

Results chapter, Chapter 6, summarizes the results obtained in this study. Statistical analysis is added whenever necessary. The significance of the results are discussed, identified trends and their reasons are studied in this chapter. Industrial differences, as well as the distinctions between small and large firms, are also presented there.

Conclusion part, Chapter 7, interprets the results, and investigates whether they are in accordance with the economic policies followed by the governments. In other words, we try to see the effects of January 24 measures on the profitabilities of firms. The adaptation capabilities of Turkish firms to the changing economic conditions is analysed in this chapter.

The names of the firms studied and their industries are listed in Appendix A. The used balance sheets and income statements of the 47 firms for the years 1981-84 appear in Appendix B. Appendix C presents detailed results of 13 financial ratios. Lower and upper quartiles, and median values for the analysed financial ratios are given in Appendix D. Appendix E explains the format of the financial data stored on a IBM-PC compatible diskette. It also includes a user manual for the appended financial ratio analysis program.

CHAPTER TWO

WORLD AND TURKISH ECONOMIES FOR THE YEARS 1981-84

2.1 WHY DO WE STUDY THE ECONOMIC ENVIRONMENTS

The firms analysed operate in their industries, and these industries are influenced by the changes in Turkish economy. Since one of the aims of January 24 stabilization measures is to integrate Turkish economy with the outside world, it has also been affected from the world economy with an increasing rate.

So, before beginning the financial analysis of firms, we will briefly survey the changes, first in the world, then in Turkish economy between 1981-84. The factors that most likely affect the profitabilities of firms will be paid more attention.

2.2 DEVELOPMENTS IN THE WORLD ECONOMY DURING 1981-84

Combat against inflation was in the forefront of developments in the world throughout 1981 and 82. Industrialised western countries had to resort to certain

stability measures, with tight monetary policies in particular, in order to maintain economic stability. Low and even negative growth rates were widespread. The economic slow down observed in the industrialized countries, adversely affected not only their own economies but also the economies of the developing countries.

Positive results of these policies were seen as from 1983 and the development rates of various countries shifted from negative to a positive trend. Meanwhile, the rate of inflation was under control.

The simple average of the real increases in the GNP's of 7 western industrialized countries was only 0.8% in 1981, and it dropped to -0.4% in 1982. Significant improvements were seen in 1983 and the average increased to 2.7% in 1983 and 3.6% in 1984. A series of decreasing rates were observed for the average of inflation in these countries, 10.1% in 1981, 7.3% in 1982, 6.4% in 1983, and 5.1% in 1984. [Calculated from 1-6]

Although some improvements were also seen in the economies of petroleum producing countries, non petroleum producer developing countries and eastern bloc countries, they were not as encouraging as the ones in industrialized countries.

Other developments observed during the 1981-84 period can be summarized as follows :

- i) The world trade volume did not note a real growth

between 1981-83, only in 1984 a value of 3% increase was attained. During 1981-84, especially developed countries followed a relatively protectionist foreign trade policy, in particular for finished-goods imports.

ii) It is hard to say that there were any achievements in reducing the rate of unemployment, however, in some countries positive trends were seen.

iii) An increase in the value of US\$ against other convertible currencies was observed. Those increases were as follows: 1%, 6%, 5%, and 30%, for the years 1981 through 84. [Calculated from 1-6].

iv) The balance of demand and supply, the ineffectiveness of OPEC, the Gulf War, and other reasons caused the oil prices to go down during the period, also creating some problems.

v) The financial crisis which started in 1980, ended in 1983, and the international financial markets became favorable with the reduction in the costs of credits.

2.3 TURKISH ECONOMY 1981-84

As indicated in the previous section, world economic conditions did not present favorable effects for Turkish economy during this period, except for the last year. We must note that the positive results seen in 1983 and 84 in developed countries did not repeat themselves in developing

countries, high inflation was still a problem.

Turkey reached 1980 with economic difficulties because for years a reliable stability policy commensurate with the national resources and realities had not been implemented, and short-term considerations had been given priority over the long-range interests. The main 3 problems were a high inflation, decreasing growth rate, and foreign exchange difficulties.

A new understanding, that we call January 24, 1980 stabilization measures, has been promoted since 1980. To reduce the inflation rate and to improve the balance of payments were the two aims to achieve. The new understanding can be summarized as the realization of a real market economy based on free competition. Reaching satisfactory unemployment and growth rates gained importance later. The following policies have been promoted:

i) Market forces would govern the economy and direct state intervention in economic activities has been relatively reduced.

ii) The fixed foreign exchange rate system was abandoned and replaced by a daily adjusted flexible and realistic foreign currency rate policy, yet a completely free market was not possible.

iii) Replacement of imports criteria was replaced by the principle of outward orientation of the economy. Decreased domestic demand, inflated exchange values against

TL, and other incentives forced exports in every industry. But instead the industries in which Turkey has comparative advantage had to be encouraged.

iv) Government would determine the interest rates, considering the money supply and financial markets, above the current inflation rates. Again, banks could not determine the deposit interest rates themselves.

Annual growth in GNP became positive in 1981 and reached 4.1%, stayed the same in 1982 with 4.5%, but decreased to 3.4% in 1983. With a 5.9% increase, 1984 was the best year. These figures are satisfactory especially if we consider the international environment during these years. But in our country population increases about 3% annually, so a real increase less than 3% means a decrease in GNP per capita. During the period the composition of GNP had also changed. The weight of agriculture and services steadily decreased, from 20.6% to 18.4%, and from 53.4% to 52%, respectively. Meanwhile, the percentage of production increased to 29.6% from 27.%

The cost of living in Istanbul increased in decreasing rates, 38%, 33%, and 29%, but in 1984 it again jumped to 46%. [8] If we analyse wholesale price indices we calculate the following figures for the percentage increases with respect to the previous years [7] :

	1981	1982	1983	1984
General	37	25	31	52
Industrial raw-materials and semi-finished goods	31	30	35	42

We clearly see that the upward trend was felt in wholesale prices earlier, in 1983. The governments were not successful in curbing the inflation while the rates in the world were coming down.

Except for the increasing foreign debt, satisfactory results were obtained in international relations. The following figures are in billion US\$ [8] :

	1981	1982	1983	1984
Imports	8.9	8.8	9.2	10.8
Exports	4.7	5.7	5.7	7.1
Total foreign debt	15.5	16.2	16.8	19.9

The importance of industrial products in exports increased to 78% from 49%, whereas the share of agricultural goods dropped to 25% from 47%. Investment goods constitute about 25% of the imports. The percentage of crude oil in imports decreased steadily due to its lower prices. Consumer goods formed 2% of the imports 1981, this figure increased to 4.5% in 1984. Imported consumer goods did not compete with domestic products on the price basis but on the quality basis, so they did not cause the domestic prices to come down. The group of countries that Turkey exported to or imported from did not show significant differences during that period.

Unemployment rate was stable around 16%. An important drop was seen in tax collections in 1984, this caused an increasing budget deficit. This deficit can be the reason of the high inflation in 1984. Various funds were established especially after 1983. Fixed investments were about 19% of GNP, and the share of public in those investments was also the same with 60%.

In our study we have enough sample firms for 6 industries. Production figures for those industries are given below. [Calculated from 1-6] Those will be useful for evaluating the financial results presented in the following chapters.

(With 1968 factor prices and in billion TL)

	1981	1982	1983	1984
Textiles, apparel, leather	536	918	1301	1402
Forestry prod., wood furnit.	165	375	508	523
Chemic., petr. deriv., plast.	1379	1911	2956	3248
Soil based products	181	335	444	491
Metals	578	849	1457	1642
Metal. goods, mach., instrum.	270	551	835	947

The analysis of the following financial figures which are related with the subject of our study will form the last section of this chapter [7-8] :

	1981	1982	1983	1984
Money supply-M1(Billion TL)	972	1342	1941	2195
Industrial bank cr.(Bil TL)	459	557	526	854
Ind. Central Ba cr.(Bil TL)	261	267	336	193
\$ buy.rat. as of yearen(TL)	132	185	280	443
6-mon. depos. int. rates(%)	50	50	47	52
Credit interest rates				
Short-term(General) (%)	36	36	Free	Free
Long-term (%)	40	40	Free	Free
Gold pr.(/gr)-yearly av(TL)	1611	2123	3595	4439
New Issues (Billion TL)				
Govern.bonds,Treas.bills	135	70	239	1019
Private bonds	15	11	16	12
Common stocks	25	109	96	12

No significant developments have been observed in the financial markets. So firms had to rely on bank credits as the only outside source. It is interesting to note that government was more active than the private sector in establishing new instruments to finance its activities. Islamic banks formed a new source for some firms. Instead of a fixed financial expense they used a system which depended on profit sharing.

Interest expenses paid on the credits obtained from banks were high even if we consider the inflation rate.

Increases in the value US\$ also affected the prices of inputs that were imported or influenced from imports. Although the international oil prices were stable in that period, increases in the \$ value, caused the domestic prices to go up, but at a slower rate.

We do not have reliable figures for the income distribution in Turkey. But it was generally accepted that the gap between high and low income groups expanded, causing the middle class to diminish. This increased the demand for some luxurious goods, but for many domestic products demand decreased because of improper income distribution. A strong middle class is also necessary for a working financial market.

The figures used in this chapter are collected, compiled and calculated from sources 1-8 indicated in the bibliography.

CHAPTER THREE

FINANCIAL RATIO EXPECTATIONS IN THE RESTRUCTURING PERIOD

We have analysed the economic environments in the previous chapter. Now we will state our financial ratio expectations under those conditions.

3.1 PROFIT MARGIN EXPECTATIONS

January 24, 1980 measures aim the realization of a real market economy based on free competition. Competition from foreign firms came into scene during the period and the profit margin in developed countries is much lower than Turkey. So we expect decreases in the profit margins of firms in the restructuring period.

3.2 TURNOVER EXPECTATIONS

With decreasing profit margins and increasing real GNP's we expect higher turnovers in the restructuring period.

3.3 DEBT RATIO EXPECTATIONS

Banks form the only outside sources for firms and deposit interest rates were determined well above inflation during the period. Banks in Turkey are not efficient in transferring the source which is deposits to the firms as credits. So we observed very high costs for the credits obtained from banks. As a result we expect the firms to decrease their liabilities and strengthen their equities.

3.4 EXPECTATION FOR THE RELATION BETWEEN PROFITABILITY AND INTEREST EXPENSE MARGIN

We expect a negative relation between profitability and interest expense margin. If a firm cannot obtain enough profit it will use outside sources to finance its operations because its equity will not be sufficient.

CHAPTER FOUR

DATA USED

4.1 PREVIOUS STUDIES OF ISTANBUL CHAMBER OF INDUSTRY (ISO)

ISO ranks the industrial private and public firms according to their sales from production and publishes the data of top 500 firms (less than 500 before 1980). [9-15] The published data is not suitable for individual firm financial analysis because only 4 financial table items are available : Sales, Equity, Total Assets (after 1982), and Earnings before tax. Detailed figures are distributed for only the total of 500 firms, but we cannot use them for a sound analysis because of two reasons :

i) Every year top 500 firms change. The variations observed in the total financial statements can have two reasons :

a) There are trends in the economy, or

b) The firms have changed.

Our aim is to find out the trends but with the given total statements we cannot distinguish between these effects.

ii) In many cases, increase in one firm will cancel the effect of a decrease in another, so the totals will seem unchanged. If we only analyse the totals we cannot examine

the trends in individual firms.

Considering these two drawbacks ISO, itself, publishes some studies about the changes in sales and profitabilities. [15-16]

In the latest study, they analysed the financial ratios of the same 100 private industrial firms for the years 1979-84. They also have given total figures for every industry. So in this study the first mentioned drawback, which is changing firms, is satisfied. But the second one, the cancelation effect, still remains because they use totals instead of individual figures. As we stated earlier only 4 financial table items have been published by ISO and in their study they used those items. It is clear that it is not possible to arrive at conclusions using only 4 financial values. Maybe one can find general trends but he cannot explain their reasons.

Although not enough, ISO's publishes about top 500 firms are one of the limited sources for financial data in Turkey. They can be used to identify the general trends in the economy. In our study we used those data for only determining the significance of the firms, that we examined in our analysis, in Turkish economy.

4.2 THE SIGNIFICANCE OF THE SELECTED FIRMS IN THEIR INDUSTRIES AND IN TURKISH ECONOMY

We selected 47 firms for analysis using the following criteria :

i) It must be a private firm.

State owned firms are more affected from daily political decisions. Also the financial statements of private firms are obtained more easily.

ii) Complete financial information must be present to construct the balance sheets and the income statements for the years 1981-84.

iii) The firms must either be listed among the top 500 of ISO, or has a 1984 net sales volume of one billion TL or more.

416 private and 84 public firms are given in the 1984 top 500 list, and 37 of the 47 firms we used are in the list, such that,

14 firms between 1-100,

14 firms between 101-200,

8 firms between 201-300, and ,

1 firm between 301-400 .

Other firms are not in the list but have sales of one billion TL or more. In some cases unlisted firms have higher sales than the ones given in the top 500.

ISO divides the production sector into 12 industries.

We used the same following industries in our study :

- 1- Mining
- 2- Food, beverages and tobacco
- 3- Textiles, apparel and leather
- 4- Forestry products and wood furniture
- 5- Paper, paper products and printing
- 6- Chemicals, petroleum derivatives and plastics
- 7- Soil based products
- 8- Metals
- 9- Metallic goods, machinery and instruments
- 10- Automotive
- 11- Other production
- 12- Electricity

Throughout the text sometimes industry codes, 1-12, are given to indicate the industry.

In some industries we have enough sample firms and in some others we do not. To determine the significance of the firms at hand for the industries and for Turkish economy, we used the ISO 1984 top 500 list as the basis, because they used the same industries. The following list will be useful for an avaluation :

Ind. code	1984 ISO top 500 list			In our study			Represent. percentage of the industry (%)
	no of firms	no of private firms	no of public firms	no of firms	no of firms in top 500 list	no of firms not in top 500 list	
1	23	4	19	-	-	-	-
2	77	71	6	2	2	-	7
3	102	80	22	5	4	1	6
4	5	4	1	2	-	2	21
5	20	11	9	1	1	-	9
6	73	68	5	9	6	3	10
7	46	36	10	13	12	1	34
8	27	21	6	5	5	-	24
9	103	98	5	9	6	3	8
10	22	21	1	1	1	-	5
11	1	1	-	-	-	-	-
12	1	1	-	-	-	-	-
Totals	500	416	84	47	37	10	

Representation percentage of the industry shows the percentage of the private firms in the 1984 ISO top 500 list that are represented in our study. These percentages are our main criteria and include some estimations about the unlisted firms.

We assume that results obtained for industries 4,6,7, and 8 where our data represents more than 10% of the private top 500 firms are significant. For industries 3 and 9 results are also given but they must be treated carefully. For other industries although we have sample firms, we have not arrived at any conclusions. The complete names of firms

used, their industries and ranks in the 1984 ISO top 500 list are given in Appendix A.

As a total the firms used in our study represents about 17% in sales and gross value added of the 1984 ISO top 500 private firms. The percentage drops to 9% if we consider not only private but also the public firms. We must also include the fact that these 500 firms represent 34% of the Turkish production sector in created income in 1984.

4.3 THE FORMATS OF THE USED FINANCIAL STATEMENTS

Today, in Turkey, Cihangir Samin's Financial Analysis series are the only publicly available sources in which we can find collections of detailed financial data for individual firms. In these books rather than the financial statements some items and ratios are given. But it is possible to construct balance sheets and income statements using the data given for every firm.

In our study, balance sheets and income statements of 47 firms for the years 1981-82-83-84 were constructed using the data given in Cihangir Samin's Financial Analysis-volume 8. 27 financial items for every year were used to construct the financial statements. Many adjustments and corrections were made to obtain true and meaningful statements. But we did not change the original data given in the book as far as possible.

Firms and their balance sheets and income statements for the years 1981 through 84 are given in Appendix B. The statements are given in million TL, in some cases 10 million TL. The percentages of the items are also written taking total assets in the balance sheets and net sales in the income statements as the basis.

The financial statements are stored on a IBM-PC compatible flexible diskette. Programs written in Turbo Pascal programming language were used to convert the data given in Samin's book into meaningful financial statements.

4.3.1 FORMAT OF THE BALANCE SHEETS

1- Current Assets	(2+3+4+5+6)
2- Cash and Banks	
3- Marketable Securities	
4- Accounts Receivables	
5- Finished Goods Inventories	
6- Other Current Assets	
7- Net Fixed Assets	(8-9)
8- Fixed Assets	
9- Accumulated Depreciation	
10- Other Tangible Assets	(11+12)
(Long-term receivables, fixed valuables, investments in affiliates, continuing investments)	

11- Continuing Investments	
12- Others	
13- Other Assets	
14- TOTAL ASSETS	(1+7+10+13)
15- Total Liabilities	(16+17+18)
16- Current Liabilities	
(Current portion of long term debts, short term loans from banks, trade payables, other short term liabilities)	
17- Middle and Long Term Liabilities	
(Bonds in circulation, other middle and long term debts)	
18- Other Liabilities	
19- Stockholders' Equity	(20+21+22-23+24)
20- Paid-up Capital	
21- Reserves	
22- Provisions	
23- Accumulated Loss	
24- Before Tax Profit	(Same as 38)
25- TOTAL OF LIABILITIES AND EQUITY	(15+19)

Revaluation fund values are not included in the balance sheets. Round-off errors are not present, all balance sheets balance. Before tax profit figure is carried from the income statement.

4.3.2 FORMAT OF THE INCOME STATEMENTS

26- Net Sales	
(Gross sales - Discounts from the sales revenues)	
27- Cost of Goods Sold	
28- Gross Profit	(26-27)
29- Selling and Administrative Expenses	(30+31)
30- Selling Expenses and Taxes	
31- General Administrative Expenses	
32- Operating Profit	(28-29)
33- Other Losses or Income	(35-34)
34- Other Losses	
35- Other Income	
36- Earning Before Interest and Tax (EBIT)	(32+33)
37- Interest Expense	
38- Earning Before Tax (EBT)	(36-37)
39- Tax	
40- After Tax Profit	(38-39)
41- Primary Legal Reserve	
42- Profit for Distribution	(40-41)

As seen the statements are in a theoretically correct format, and are suitable for financial ratio analysis.

CHAPTER FIVE

ANALYSED FINANCIAL RATIOS

5.1 FINANCIAL RATIO ANALYSIS

The analysis of financial statements is typically devoted to the calculation of ratios in order to evaluate the past, current and projected performance of the business firm. Ratio analysis is the most common form of financial analysis. It provides relative measures of the company's performance. A number of other techniques for measuring certain aspects of corporate performance are used, but the financial ratio is the most commonly cited. The basic inputs to financial analysis are the firm's income statement and balance sheet for the period(s) to be examined. Using the data provided by these statements, various ratios can be calculated that permit an evaluation of certain aspects of the firm's performance.

There are two basic ways in which financial ratios are used :

- 1) In a cross-sectional approach, and
- 2) In time-series analysis.

The cross-sectional approach involves the comparison of different firm's financial ratios at the same point in time. The firm's performance is compared to that of the

industry leader or to the industry average. In Turkey, in most cases, these figures are not available. In our study we calculated industry averages, both weighted and simple, for the industries that we have enough sample firms. These values can be used to evaluate the performances of individual firms.

Our aim in this study is to identify the trends in the profitabilities of firms for the years 1981 through 84, so time-series analysis, which measures a firm's performance over time, was used. Developing trends were seen by using multi-year comparisons.

We know that, for a good evaluation, audited financial statements that are prepared for the same period using the same accounting methods must be used. The presented financial statements are not audited and different approaches were used to prepare them, but they are the best available. This point must be considered in evaluating the results of the study.

It is clear that the financial statements in Turkey are not very dependable. In some cases the errors are obvious, and in some others, the published figures are possible but not meaningful. During the study we have encountered unbalancing balance sheets, and negative values for some items, such as accumulated loss, tax and primary legal reserve. We accepted that these are the typing errors of the source book and corrected them. But as will be seen,

some firms provided zero figures for their inventories, investments, pre-paid expenses, selling expenses, administrative expenses, other losses or incomes, and interest expenses. We did not have any chance to correct them but this shows that the financial statements were not well prepared.

5.2 FINANCIAL RATIOS THAT MEASURE PROFITABILITY

Financial ratios can be divided into 3 basic groups : liquidity and activity ratios, debt ratios, and profitability ratios.

There are many measures of profitability. Each relates the returns of the firm to its sales, to its assets, or to its equity. The important point is that in a financial ratio that measures profitability the revenue in the numerator must be directly related with the source indicated in the denominator.

5.2.1 PERCENT INCOME STATEMENT

A common approach for evaluating profitability in relation to sales is the percent income statement. By expressing each item on the income statement as a percentage of sales, the relationship between sales and specific revenues and expenses can be evaluated. Percent income

statements are especially useful in comparing a firm's performance for one year with that for another year. Since in our study, all percentages for the income statements are given, this comparison can be made for every item. Specifically two ratios are analysed, gross profit margin, and operating profit margin.

5.2.2 GROSS AND OPERATING PROFIT MARGINS

The gross profit margin, which is gross profit over net sales, indicates the percentage of each sales revenue remaining after the firm has paid for its goods.

Operating profit over net sales ratio is called the operating profit margin. Operating profits ignore any financial or government charges, which are interest and taxes, other losses or income, and measure only the profits earned by the firm on its operations.

5.2.3 OVERALL PROFITABILITY

Profitability which is often called the firm's return on total assets, measures the overall effectiveness of management in generating profits with its available assets. It is calculated as follows :

Earnings Before Interest and Tax (EBIT)

$$\text{Profitability} = \frac{\text{Earnings Before Interest and Tax (EBIT)}}{\text{Total Assets}}$$

Utilizing DuPont formula, the firm's profitability can be found in an alternate fashion,

$$\text{Profitability} = \frac{\text{EBIT}}{\text{Net Sales}} \times \frac{\text{Net Sales}}{\text{Total Assets}}$$

EBIT excludes interest expenses and tax, but considers other losses or income, so profits gained from the operations that normally are not directly related with the firm's business, are also included. The total asset turnover, sales over total assets, indicates the efficiency with which the firm is able to use its assets to generate sales revenue.

The DuPont formula allows the firm to break down its profitability into a profit-on-sales component and an asset efficiency component. Typically a firm with a low profit margin has a high total asset turnover, which results in a reasonable good profitability, or vice versa.

5.2.4 OPERATING PROFITABILITY

Besides EBIT over total assets we also have studied operating income to operating assets ratio. Operating assets are the assets that are used to generate the operating income, typically total assets minus investments. This new ratio explains the efficiency of management better than the previous one. We broke down the operating profitability into two components and analysed the relations, such that,

$$\text{Operating profitability} = \frac{\text{Operating Income}}{\text{Net Sales}} \times \frac{\text{Net Sales}}{\text{Operating Assets}}$$

5.2.5 RETURN ON EQUITY

The return on equity measures the return earned on the owners' investment. Return on equity is calculated as follows :

$$\text{Return on Equity} = \frac{\text{After tax profit}}{\text{Stockholders' equity}}$$

Using the modified DuPont formula,

$$R \text{ on } E = \frac{\text{Net profit margin} \times \text{Total asset turnover}}{(1 - \text{Debt Ratio})}$$

where debt ratio is total liabilities over total assets:

$$1 - \text{Debt ratio} = \frac{\text{Total assets} - \text{Total Liabilities}}{\text{Total assets}} = \frac{\text{Equity}}{\text{Tot. assets}}$$

In this study, we analysed R on E as the product of three ratios, namely

$$R_{onE} = \frac{\text{After tax profit}}{\text{Net sales}} \times \frac{\text{Net sales}}{\text{Total assets}} \times \frac{\text{Total assets}}{\text{Equity}}$$

5.2.6 RATIOS RELATED WITH FINANCIAL EXPENSES

At the end we analysed some ratios that are related with interest expense.

Times Interest Earned, which is defined as the ratio of EBIT to the interest expense, measures the firm's ability to pay its contractual interest payments. Interest expenses over total debt gives the average interest rate for the firm.

Interest expenses as a percentage of sales indicates the weight of financial expenses in the sales volume.

5.3 CONFIDENCE INTERVALS FOR THE CALCULATED FINANCIAL RATIOS

The following formula is given to determine the confidence interval by using a small sample from a normal (or approximately normal) distribution :

$$\left[\bar{x} - t \frac{s}{\sqrt{n}} , \bar{x} + t \frac{s}{\sqrt{n}} \right]$$

In our study, sample size, n is 47. Sample standard deviation, s, is calculated using (n-1) in the denominator. Since we obtained the mean from our data, degrees of freedom is 46. \bar{x} is the sample mean, and t is the t value for a given probability level. For 90% confidence intervals with our sample, t value is 1.688 .

For every financial ratio analysed, we have given 90% confidence intervals, with n=47 and t=1.688 , using the formula,

$$\left[\bar{x} - 0.246 s , \bar{x} + 0.246 s \right]$$

5.4 RELATION BETWEEN PROFITABILITY AND INTEREST EXPENSE MARGIN

We know that if firms use much credits, then due to high interest costs, they cannot make profits. But, what are the reasons of these high borrowings? Is the reason the firm's own operations? In our study we tested the hypothesis, "If the firms are not profitable, i.e. they cannot obtain enough profits from their operations, then they use outside sources and this increases their interest expenses.". In other words, the reason of a high interest expense thus a loss is the unprofitability of the firm's operations.

EBIT to total assets ratio gives us the best identification of profitability. We studied several ratios to find out the one that will properly show us whether the interest expense item in an income statement is low or high. At last we decided on interest expense to net sales ratio.

Our problem is now reduced to find the correlation between

EBIT	Interest, expense
-----	-----
Total assets	Net sales

and

Our linear regression program used the following model :

$$\frac{\text{EBIT}}{\text{T.A.}} = A + B \frac{\text{Interest exp.}}{\text{Net sales}}$$

As $y = A + Bx$ for $x(i)$, $y(i)$, $i=1,2,3,4$

$$B = \frac{n \cdot \sum x \cdot y - \sum x \cdot \sum y}{n \cdot \sum x \cdot x - \sum x^2}, \quad A = \frac{y - B \cdot \sum x}{n}$$

$$r = \frac{n \cdot \sum x \cdot y - \sum x \cdot \sum y}{\sqrt{(n \cdot \sum x \cdot x - (\sum x)^2) (n \cdot \sum y \cdot y - (\sum y)^2)}}$$

r : correlation coefficient

r^2 : coefficient of determination

We have the financial statements of 47 firms from 1981 to 84. So for each firm 4 pairs of data are available.

CHAPTER SIX

RESULTS

6.1 OVERALL PROFITABILITY

$$\frac{\text{EBIT}}{\text{Total Assets}} = \frac{\text{EBIT}}{\text{Net Sales}} \times \frac{\text{Net Sales}}{\text{Total Assets}}$$

6.1.1 EBIT / Total Assets

	1981	1982	1983	1984
Simple averages	0.29	0.27	0.22	0.25
Weighted averages	0.27	0.24	0.19	0.23
Simp. av. stand. dev.	0.17	0.15	0.12	0.12
Stand. dev. / Simp. av.	0.61	0.54	0.52	0.49

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(0.24, 0.33)	(0.23, 0.31)	(0.19, 0.25)	(0.22, 0.28)

In all 4 years weighted averages are lower than simple averages, this shows that the profitability is lower in firms which have relatively high sizes, i.e. small firms are more profitable. The difference in profitability between small and large firms increased in 1982 and 83 but decreased during the last year.

A very important result from our analysis is that the ratio of the standard deviation to the simple average decreased during the four years, from 0.61 to 0.49 . This shows that the firms have been gathering around a common profitability figure more closely every year.

In 27 firms profitability decreased from 1981 to 82, in 20 it increased, and the average dropped to 0.27 from 0.29. A decrease from 1982 to 83 was observed in 29 firms among 47, and the average decreased significantly to 0.22 . 28 firms have higher values for 1984 than 83, and the average is around 0.25 .

Every year about 60% of the firms obey the general trend, in the 40% the situation is the opposite. 3 patterns can be identified from our data :

9 firms have, from 1981 to 82 Decrease, from 1982 to 83 Decrease, and from 1983 to 84 Increase ,

8 firms have , Decrease, Decrease, Decrease , and

8 firms have , Increase, Decrease, Increase trend.

Industrial data is as follows :

	1981	1982	1983	1984
Textiles, apparel, leather	0.20	0.25	0.23	0.26
Forestry products, wood furniture	0.22	0.44	0.33	0.32
Chemicals, petrol. deri., plastics	0.26	0.25	0.19	0.19
Soil based products	0.41	0.34	0.22	0.28
Metals	0.15	0.15	0.19	0.16
Metallic goods, machn., instrumen.	0.27	0.25	0.26	0.31

Soil based products industry was the best in 1981 but they lost the leadership to forestry products and wood furniture in the following years. Metals industry had the lowest profitability figures for all years.

6.1.2 EBIT / Net Sales

	1981	1982	1983	1984
Simple averages	0.20	0.21	0.19	0.19
Weighted averages	0.19	0.19	0.16	0.19
Simple av. stand. dev.	0.10	0.12	0.09	0.09
Stand. dev. / simple av.	0.52	0.55	0.48	0.49

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(0.17,0.22)	(0.18,0.24)	(0.16,0.21)	(0.17,0.21)

Small firms had slightly higher profit margins than larger firms, and no difference existed in 1984. Except 1982, profit margins had the same distribution pattern because standard deviations as a percentage of simple averages were about 50%. In 1982, this percentage increased to 55% which shows that the profit margins were relatively more far away from the average.

Considering also the safety margins, the profit margin remained the same during the 1981-84 period in Turkish economy, although a small increase in 1982 and tiny decreases in 1983 and 84 were observed.

2 trends among the firms deserve mention, in 10 firms Increase Decrease Increase, and in 9 firms Decrease Decrease Increase trends were noticed.

Industry analysis showed that the industry with the highest profit margin was forestry products and wood furniture, except 1981 when soil based products is the best, and chemicals, petroleum derivatives and plastics firms had the lowest profit margins.

6.1.3 Net Sales / Total Assets

	1981	1982	1983	1984
Simple averages	1.50	1.41	1.23	1.35
Weighted averages	1.43	1.24	1.19	1.23
Simple av. stand. dev.	0.58	0.63	0.33	0.28
Stand. dev. / simple av.	0.39	0.45	0.27	0.28

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(1.36,1.65)	(1.26,1.57)	(1.15,1.31)	(1.26,1.45)

Small firms had higher asset turnovers than larger firms, but the difference changed every year. Asset turnovers of firms concentrated around common averages in 1983 and 84. But such limits could not been found for 1981 and 82 because standard deviation over average ratios were 0.39 and 0.45 respectively.

Asset turnovers of 32 firms decreased from 1981 to 82, and the average dropped to 1.41 . This decrease in average continued in 1983 reaching to 1.23 . But from 1982 to 83, 26 firms experienced decreasing and 21 firms increasing turnovers. The average increased to 1.35 in 1984, we see 33 firms increasing their asset turnovers that year. A common trend of Decrease Increase Increase can be extracted from the data.

Soil based products industry had the highest asset turnover rates for the first three years, giving the leadership to chemicals,petroleum derivatives and plastics industry in 1984. Metals industry had the lowest figures except 1984 during which forestry products and wood furniture had the minimum.

Since we have reviewed all 3 ratios, we can reach to general conclusions about overall profitability.

Although profit margins of firms increased a little in 1982 relative to 1981, because asset turnovers decreased significantly, the profitabilities in Turkey also decreased in 1982. Both the margins and turnovers had lower values in 1983, so the firms experienced a dramatic drop in their profitabilities in that year. Although the profit margins remained constant, due to an important increase in asset turnovers, the firms obtained higher profitabilities in 1984.

6.2 OPERATING PROFITABILITY

$$\frac{\text{Operating Profit}}{\text{Operating Assets}} = \frac{\text{Operating Profit}}{\text{Net Sales}} \times \frac{\text{Net Sales}}{\text{Operating Assets}}$$

6.2.1 Operating Profit / Operating Assets

	1981	1982	1983	1984
Simple averages	0.31	0.28	0.23	0.26
Weighted averages	0.29	0.25	0.21	0.25
Simple av. stand. dev.	0.19	0.15	0.13	0.14
Stand. dev. / simple av.	0.63	0.54	0.54	0.54

90% confidence intervals for simple averages :

1981	1982	1983	1984
(0.26,0.35)	(0.24,0.32)	(0.20,0.26)	(0.22,0.29)

We expect the operating profitability to be in parallel with the profitability discussed previously. There are similarities but also some differences. As before small firms had better operating profitabilities than larger ones. Standard deviation to the average ratio decreased continuously in overall profitability, but here we observe a drop only 1982, during the last two years, this ratio remained at its 1982 level of 0.54 . This shows that investments to other businesses and the return obtained from them cause the firms to have more uniform profitability distributions.

Another important result is that investments to others are not as profitable as the firm's own activities in Turkey because operating profitabilities are always higher than the profitabilities which include investments.

Average operating profitability dropped to 0.28 in 1982 and further to 0.23 in 1983 from its initial value of 0.31 in 1981. We observe an increase to 0.26 in 1984 only. If we look at the individual firms, we see that , in 1982, 28 firms had decreasing, and 19 firms increasing , in 1983, 29 firms had decreasing, and 18 firms increasing , in 1984, 29 firms had increasing, and 18 firms decreasing ,

operating profitabilities. This shows that as before 60% of firms obeyed the common trend.

We observe that Decrease Decrease Increase trend was followed by 11 firms out of 47 which is about 25% of the total firms.

Soil based products industry had the highest figure in 1981, but throughout the following years, forestry products and wood furniture had been the best. Metals industry always had the lowest operating profitabilities.

6.2.2 Operating Profit / Net Sales

	1981	1982	1983	1984
Simple averages	0.20	0.21	0.18	0.18
Wighted averages	0.18	0.19	0.16	0.19
Simple av. stand. dev.	0.11	0.12	0.10	0.10
Stand. dev. / simple av.	0.56	0.57	0.53	0.54

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(0.17,0.22)	(0.18,0.23)	(0.16,0.21)	(0.16,0.21)

A slight increase in 1982 was seen relative to 1981, then the ratio remained stable around 0.18 . A small difference existed between the small and large firms in operating profit margin. A relative and sudden increase in

the operating profit margins of larger firms shows that they restructured themselves better than the small ones in their operations. The distribution was observed to be the same throughout these 4 years. Individual firm analysis shows that about 27 firms obeyed the trend of that year, i.e. 57% of all the firms, the others had the opposite pattern.

6.2.3 Net Sales / Operating Assets

	1981	1982	1983	1984
Simple averages	1.61	1.52	1.34	1.44
Weighted averages	1.55	1.34	1.31	1.33
Simple av. stand. dev.	0.63	0.69	0.38	0.41
Stand. dev. / simple av.	0.39	0.45	0.28	0.28

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(1.45, 1.76)	(1.35, 1.69)	(1.24, 1.43)	(1.34, 1.54)

While we observed 6% and 12% decreases in 1982 and 83 respectively, and a 8% increase in 1984 in the simple averages, we saw an important decrease of 14% only in 1982 in weighted averages, then they stayed at the same level. It means that in 1982, especially large firms reached a stable sales over operating assets ratio of 1.32. We notice two different distribution patterns, a 42% in the first, and a

28% in the last two years. It is interesting to note that 14 firms had the Decrease Increase Increase trend which is not the average.

There is no much difference among the industries, soil based products industry had always the highest sales over operating assets figures and metals industry had the lowest.

A general comment about operating profitability can be as follows :

Slight differences in operating profit margin does not affect the operating profitability, it is mainly determined by the sales over operating assets ratio. In Turkey operating profitability stayed about 27% for the years 1981 through 84 within a plus minus 4% margin

6.3 RETURN ON EQUITY

$$\begin{array}{r}
 \text{After tax profit} \quad \text{Net Sales} \quad \text{Total Assets} \\
 \text{R on E} = \frac{\text{-----}}{\text{Net Sales}} \times \frac{\text{-----}}{\text{Total Assets}} \times \frac{\text{-----}}{\text{Equity}}
 \end{array}$$

6.3.1 After tax profit / Equity

	1981	1982	1983	1984
Simple averages	-0.06	0.11	0.15	0.16
Weighted averages	0.27	0.21	0.17	0.18
Simple av. stand. dev.	1.62	0.75	0.10	0.13
Stand. dev. / simple av.	-26.59	6.74	0.62	0.85
Weighted av. stand. dev.	1.65	0.75	0.10	0.14
Stand. dev. / weighted av.	6.03	3.59	0.58	0.75

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(-0.46,0.34)	(-0.07,0.29)	(0.13,0.18)	(0.12,0.19)

For the first two years standard deviations are much larger than the simple or weighted averages. If we analyse the data for individual firms we see that the figures ranged from -10.29 to 0.56 for the first year, and from -4.76 to 0.56 in the second year.

A graph is drawn using the RonE data for 1981 which had the longest intervals on the next page.

y-axis represents the number of firms in that interval, and x-axis shows the RonE from -0.25 to 0.60, 3 very low values for RonE, -0.61, -3.25, -10.29 are not shown on the graph. Obviously the result is a discrete function. The graph shows that RonE had an approximately normal

number of firms

R on E (/ 100)

distribution with a mean around 0.27 . We have taken intervals of 0.02 on the x-axis, but since our sample size is small, it could have been more than 0.02, then it will more look like a normal distribution.

For 1981, the reason for a long interval is obvious, 3 very low values of RonE. If we discard low values, we see that the interval is between 0.1 and 0.5 .

A mean value of 0.27 for 1981 was reached after a statistical study but it had been given by the weighted average. Unlike the other ratios standard deviation over average ratio is lower in weighted averages than in simple averages. So we will use weighted averages as our basis.

Return on equity ratios had long intervals in 1981 and 82 only, for the last two years common averages could be found. We see that at the beginning of the restructuring period in Turkish economy some firms could not adapt themselves to the changing conditions, but some could. Beginning from 1983, the majority of firms started to make reasonable profits under the new conditions.

Average RonE, dropped to 0.21 in 1982, and further to 0.17 in 1983 and stayed the same in 1984. If we analyse the individual firms, from 1981 to 82, 22 firms increased, 25 firms decreased their RonE's. From 1982 to 83, we have 16 increasing, 31 decreasing ratios and finally from 1983 to 84, 27 increasing, 20 decreasing ratios are observed. So 53% in 1982, 66% in 1983, and 57% in 1984 obeyed the general trend

in economy.

Now, we present an industrial analysis :

	1981	1982	1983	1984
Textiles, apparel, leather	0.28	0.25	0.24	0.21
Forestry products, wood furniture	0.13	0.38	0.26	0.29
Chemicals, petrol. deri., plastics	0.23	0.21	0.17	0.17
Soil based products	0.41	0.35	0.17	0.20
Metals	0.13	0.06	0.15	0.12
Metallic goods, machn., instrumen.	0.23	0.16	0.15	0.19

In 4 of the 6 industries we observed steady drops from 1981 to 83, only in 1984 some improvements were noticed, other 2 industries had great fluctuations from year to year.

6.3.2 After tax profit / Net Sales

	1981	1982	1983	1984
Simple averages	0.06	0.08	0.07	0.07
Weighted averages	0.06	0.08	0.06	0.07
Simple av. stand. dev.	0.08	0.09	0.06	0.07
Stand. dev. / simple av.	1.26	1.03	0.84	0.95

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(0.04, 0.08)	(0.06, 0.11)	(0.06, 0.09)	(0.06, 0.09)

In 1981, we have 6 firms with before tax losses (13% of the total), in 1982 they dropped to 4 (9%). 3 of these 4 firms were in loss in 1981 also. In 1983 we have only one loosing firm (2%) which was not in loss before. We see 2 firms (4%) with negative profits, they had not experienced any losses before, either, in 1984.

There is no difference between small and large firms in after tax profit margin. The ratio itself remained constant also during the four years. But the distributions about the means showed some differences, with decreasing standard deviations till 1983, and a small increase in 1984. Ratio trend analysis showed us that Increase Decrease Decrease pattern was followed by 12 firms (26%).

Soil based products and forestry products and wood furniture industries were the best, and metals was the worst industry in after tax profit margin.

Net Sales / Total Assets

ratio was studied in section 6.1.3 .

6.3.3 Total Assets / Equity

	1981	1982	1983	1984
Simple averages	5.02	4.64	2.38	2.32
Weighted averages	3.00	2.25	2.26	2.01
Simple av. stand. dev.	7.53	10.80	1.17	1.17
Stand. dev. / Simple av.	1.50	2.33	0.49	0.50

$$\text{Debt Ratio} = \text{Total Liabilities} / \text{Total Assets}$$

	1981	1982	1983	1984
Simple averages	0.80	0.78	0.58	0.57
Weighted averages	0.67	0.55	0.56	0.50

Since debt ratio is an important indicator for financial position, we give 90% confidence intervals for that ratio below ,

1981	1982	1983	1984
(0.68,0.85)	(0.49,0.86)	(0.52,0.63)	(0.51,0.62)

In our study, we saw that, equity as a percentage of total assets increased very significantly in the restructuring period in Turkey. This did not arise from an increase of the period profit, profit margins, as well as, profit as a percentage of total assets, both decreased. Because of high financial costs firms borrowed less from outside, and to maintain their operating level, they had to increase their equities. Let us remind that, revaluation is not included in our financial statements.

We see that relatively larger firms had much better debt ratios than smaller ones and their responses to the changing economic conditions are quicker than the others.

While metals industry had the highest debt ratios, there were not any stable leader industry with the lowest

figures. First year chemicals, petroleum derivatives, and plastics, second year soil based products and then forestry products and wood furniture industries obtained the best ratios.

Individual ratio trend analysis shows us that in 1982, 36 firms (77%) decreased their debt ratios relative to 1981, but the decrease percentage dropped to 53% in 1983 and 84.

RonE averages for Turkey decreased relative to the previous years in 1982 and 83. In 1984 it kept its 1983 level. After tax profit margin remained constant throughout these years. Both asset turnovers and debt ratios decreased during the period, only a small improvement was seen in asset turnover in 1984. Decreasing debt ratios, which means that equity as a percentage of total assets is increasing, is a good indicator. But together with low asset turnovers, it caused the RonE to have decreasing values.

6.4 RATIOS RELATED WITH FINANCIAL EXPENSES

6.4.1 Interest Expense / Net Sales

	1981	1982	1983	1984
Simple averages	0.076	0.077	0.074	0.074
Weighted averages	0.067	0.075	0.070	0.078
Simple av. stand. dev.	0.060	0.064	0.063	0.059
Stand. dev. / Simple av.	0.79	0.83	0.85	0.80

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(0.061,0.090)	(0.061,0.092)	(0.059,0.090)	(0.059,0.088)

For all 4 years 90% confidence interval is between 0.06 and 0.09 . In Turkey interest expense is about 6%-9% of the net sales. Neither the averages nor the distributions of the ratio changed. During the first three years the percentage of interest expense in sales was lower in larger firms, but in the last year the situation was reversed.

In textiles, apparel and leather, and metallic goods, machinery, and instruments industries this ratio was about 10%, other industries had lower figures.

6.4.2 EBIT / Interest Expense

	1981	1982	1983	1984
Simple averages	19	102	66	238
Weighted averages	2.8	2.6	2.3	2.4
Simple av. stand. dev.	67	442	356	1456
Stand. dev, / Simple av.	3.53	4.35	5.40	6.12

It is obvious that no result can be obtained with the given data. Statistically only one thing is clear, times interest earned ratio has been spreading around more and more, with increasing standard deviations.

Plotting the data on a graph did not happen to be useful, either. The following table is helpful in evaluating the ratio in Turkey.

Number of firms with times interest earned ratios :

	1981	1982	1983	1984
Between 0 - 1 (loss) :	6	4	1	2
Between 1 - 2 :	10	15	19	19
Between 2 - 3 :	12	6	8	10
Between 3 - 10 :	8	9	9	4
Between 10 - 100 :	10	9	7	7
More than 100 :	1	4	3	5

We see that the average ratio is between 1 and 3, most probably about 2. Also weighted averages show figures around 2.5 for all four years.

6.4.3 Interest Expense / Total Liabilities

	1981	1982	1983	1984
Simple averages	0.16	0.16	0.16	0.18
Weighted averages	0.14	0.17	0.15	0.19
Simple av. stand. dev.	0.12	0.10	0.14	0.13
Stand. dev. / Simple av.	0.80	0.65	0.87	0.72

90% confidence intervals for the simple averages :

1981	1982	1983	1984
(0.13,0.19)	(0.13,0.19)	(0.13,0.20)	(0.15,0.21)

In Turkey between 1981 and 83, interest expenses in the income statements were about 16% of the total liabilities in the balance sheets. This average increased 2%, to 18%, in 1984. Only metallic goods, machinery and instruments industry paid more interest than the average every year.

6.5 RELATION BETWEEN PROFITABILITY AND INTEREST EXPENSE MARGIN

The theory of this section is studied in 5.4 .

We have run a linear regression program 47 times, for every firm, to obtain the results on the next page. We have ranked the results giving the firm number and industry according to the absolute value of the correlation coefficient. It is seen that r changed from 0.98 to 0.05 for every firm. We obtained negative B values, which means that an increase in interest expense/net sales decreases EBIT/total assets, or vice versa in 29 firms. In 18 firms B is positive.

We have taken r values as weights and found weighted averages. At the end we saw that 64% of firms had negative B 's and 36% positive. From our previous analysis we know that if there is a trend in Turkish economy, only about 60% of the firms follows that trend, 40% behaves in the opposite way. So 64% seems sufficient to conclude that profitability and interest expense are negatively related.

2

CHAPTER SEVEN

CONCLUSIONS

Throughout the study, we analysed the effects of restructuring period policies in Turkey on the profitabilities of firms. These policies, as well as other environmental factors, were studied in Chapter 2, and the results of our financial analyses were discussed in Chapter 5.

Now, we will investigate whether the financial effects seen on the firms are in accordance with the policies followed by the governments. We will also analyse the adaptation capabilities of Turkish firms to the changing economic conditions.

Our observations are as follows :

i) There are no general financial trends in Turkish economy which are followed by 70% or 80% of the firms. At most 60%-65% of the firms obey an average pattern, others behave in the opposite way. For any sample data set taken from individual firms, the range is long, and the deviations from the mean are high, relative to the sample average. This gives us long confidence intervals. For a financial analysis, only sample totals or averages are not sufficient, and in some cases they are statistically meaningless under

important individual deviations. Distribution patterns are as important as the means and must be considered in the studies.

ii) Restructuring period policies had significant effects on the distributions of financial ratios in Turkey. If we take standard deviation over mean ratio as our basis, we see that it has decreased over time for all ratios, with the exception of times interest earned. Only in 1982 and for some financial ratios, increases were observed. This shows that the deviations from the means have been decreasing and the mentioned policies were successful in gathering them around common averages.

iii) Relatively small and large firms concepts have been used in our study. But we must remind that this distinction does not apply to Turkish economy because all the firms analysed in this study are very large and organized firms if we take Turkish production sector as our basis. When we say small, it means small relative to the average of our sample. We know that the average volumes in Turkish economy are much smaller than the ones we studied here.

In our sample, small firms are more profitable than relatively larger firms in general. This shows that there is an optimum volume limit for the most efficient management in Turkey, if a firm exceeds that point, then its profitability begins decreasing. But smaller firms are not as successful as the large ones in adopting themselves to new conditions.

iv) Average profitabilities, overall or operating, decreased in 1982 and 83 relative to 1981, an improvement was seen in 1984. During the 1981-83 period we observed moderate real increases in GNP and decreasing inflation rates in Turkey. 1984 is an example of high development rate and increasing inflation.

Contrary what we expect, all profit margins remained stable in the restructuring period, if we ignore one or two percent drops during the last years.

But sales turnovers decreased in 1982 and 83, and a better figure was achieved in 1984. Asset turnover is defined as the ratio of annual sales to the total assets. Sales value is the product of price and quantity and, since both inflation and GNP increased in 1984, sales volume was larger that year. Total assets did not increase as much as sales, because fixed items were not affected from the changes in the price levels.

Profitabilities of firms are mainly determined by turnovers because profit margins, were constant during 1981-84.

v) If we accept that, in the financial statements used in our analysis, normal and other incomes are distinguished correctly and the investment items in the balance sheet are true, then we can reach to the conclusion that, in general a firm's investments are not as profitable as its own operations.

vi) Debt ratio, liabilities over assets, decreased very significantly during the restructuring period in Turkey, from 80% in 1981, to 57% in 1984. As discussed in the previous chapter the reason was obvious, soaring financial costs.

vii) Return on equity, net profit over equity, decreased during the period due to the decreases in asset turnovers and debt ratios.

viii) Although liabilities as a percentage of total assets dropped, interest expense over sales ratio remained stable at 7.5% .

ix) Times interest earned, EBIT over interest expense, shows a firm's financial expense paying capability. In this ratio standard deviation as a percentage of simple average increased steadily. It is not a favorable trend, because it shows that while some firms have been adopting themselves to the increasing financial costs, some others have lost their abilities of paying interest expenses, and this will increase the bad debts of banks which are the only outside sources.

x) We found that for 64% of our sample firms there is a negative relation between profitability and interest expenses. Unprofitable firms borrow more and pay larger amounts of financial expenses.

In evaluating the above conclusions one must consider the fact that our sample data forms a good representation for only large and well organized firms of Turkish production sector. The accuracy of our results is limited with the accuracy of the used financial statements and given data.

APPENDIX E

FORMAT OF THE STORED DATA

AND

A USER MANUAL FOR

THE APPENDED FINANCIAL RATIO ANALYSIS COMPUTER PROGRAM

The financial statements presented in Appendix B are stored on a IBM-PC compatible diskette in the file FIRMINF.DAT . FIRMINF.DAT is a sequential access file and every firm holds 16 lines in that file. The format of the data is as follows :

- Line 1: Full name of the firm(character string)
- Line 2: Its industry code(integer) , its rank in 1984 ISO top 500 list(integer) [-1 if not listed]
- Line 3: Current assets , Cash and Banks , Marketable secur.
- Line 4: Accounts rec. , Finished goods inv. , Other cu. as.
- Line 5: Net fixed assets , Fixed assets , Accum. depreciat.
- Line 6: Other tangible as. , Continuing investmen. , Others
- Line 7: Other assets , Total assets , Total liabilities
- Line 8: Current liab. , Middle long term liab. , Other lia.
- Line 9: Equity , capital , reserves
- Line 10: Provisions , Accumulated loss , Before tax profit
- Line 11: Total of lia. and equity , Sales , Cost of go. sold
- Line 12: Gross profit , Selling adm. exp. , Selling expenses
- Line 13: Gen. adm. exp. , Operating profit , Other loss inc.
- Line 14: Other losses , Other income , EBIT
- Line 15: Interest Expense , Earning before tax , Tax
- Line 16: After tax profit , Pri. legal res. , Profit for di.

The financial items given in lines 3-16 are integers

and in million TL , in some cases in 10 million TL.

In every line there are three items. The items are ordered such that,

A(1) A(2) A(3) A(4) B(1) B(2) B(3) B(4) C(1) C(2) C(3) C(4)

A(1) : Item A in 1981 , A(2) : Item A in 1982

A(3) : Item A in 1983 , A(4) : Item A in 1984

B(1) : Item B in 1981 ,

USER MANUAL FOR THE APPENDED FINANCIAL RATIO
ANALYSIS COMPUTER PROGRAM :

The program which is written in Turbo Pascal needs a printer for execution. It is interactive and self-explanatory, and two example screens are given in this appendix. More than one item can be given in the numerator or in the denominator. The codes for the available financial items are given in section 4.3 .

To run the program type ,

A> FINRAT

then hit return.
