## ÖZET

Medya, kitleleri etkileyen, bilgi veren ve kamuoyu oluşturan en önemli araçlardan biridir. Medya yoluyla, “Aile Planlaması” hakkında insanlara verilen mesajlar, bireylerin karar almalarında önemli rol oynayacaktır. Konu hakkında medyaya bilgi-görüş aktaranların kimler olduğu ve bu haberlerin nasıl verildiği önemli bir analiz konusudur. Bu çalışmanın temel amacı, Türk yazılı basınının aile planlaması konularına yaklaşımını tanımlamak, basında yer alan haber/yazıların dönemsel karşılaştırmasına dayalı niteliksel ve niceliksel analizlerini yaparak, farklı gazetelerin aile planlaması konusuna dair ideolojik bakış açılarını ve savlarını tespit etmektir. Posta, Hürriyet, Sabah, Ortadoğu, Özgür Gündem, Cumhuriyet ve Zaman gazeteleri bu çalışma için seçilmiştir. Tiraj rakamlarına, ideolojik görüşlerine ve milliyetçi/etnik bakış açılarına göre seçilen bu yedi gazete, çalışmanın örneklemini oluşturmaktadır. İçerik analizi metodu kullanılarak 2001-2005 yılları arasında bu gazetelerde çıkan aile planlaması ile ilgili haberler tek tek analiz edilerek, niteliksel ve niceliksel olarak değerlendirilmiştir. Bu değerlendirme sonucunda, bütün bu analizler, gazetelerin aile planlaması ve ilgili konuları işleme biçiminde farklı bakış açılarının hakim olduğunu ortaya koymaktadır.

## ABSTRACT

Media is one of the most important instruments that influence the masses, provide information, and form the public opinion. The messages conveyed to people through the media concerning “Family Planning” will surely play a significant role in the decision making processes of individuals. It is a noteworthy point of analysis who convey opinion-information to the media on the issue and how these news reports are presented in the media. The main objective of this study is to describe the approach of the Turkish print media towards family planning issues by making comprehensive analyses among different newspapers and to determine the ideological viewpoints of different newspapers, their arguments and efforts towards family planning issue by making qualitative and quantitative analyses of the news/articles in the media through a comparison of the periods of time. The newspapers of Posta, Hürriyet, Sabah, Ortadoğu, Özgür Gündem, Cumhuriyet and Zaman have been selected for this study. These seven newspapers, selected on the basis of circulation figures as well as their ideological view and nationalist and ethnic perspective, constitute the sample of the study. Adopting the content analysis method, the family planning related news/columns that appeared in these newspapers between the years of 2001-2005 have been analyzed one by one, and evaluated in qualitative and quantitative terms. It has been observed as a result of this study and evaluations that all these analyses reveal that different perspectives dominate the ways newspapers present family planning and related issues.

## 1. INTRODUCTION

Family Planning helps couples in deciding to have children, in determining the timing of child bearing and size of the family. Thus family planning has always been an important issue for the lives of women as well as men. For performing their dual roles as mothers and wives, and active community members in the changing environment of the 21<sup>st</sup> century, “women” have begun to regard family planning practices increasingly vital to manage their roles and responsibilities.

The control over fertility has important outcomes for the life of women, which may be summarized under two headings: In the first place by avoiding unwanted pregnancies, family planning prevents deaths caused by unsafe childbearing and abortion practices, thus contributes to women’s health. Secondly by avoiding unwanted childbearing and childcare, family planning helps women manage their time more effectively and allocate more time for education, employment and other opportunities (Population Reports, 1994).

In Turkey, there has been a substantial decline in fertility rates within the last three decades as reflected by the decline from 4.3 in 1978 (HUIPS, 1980) to 2.2 in 2003 (HUIPS, 2004) in the total fertility rate<sup>1</sup>. In Turkey, there are evident discrepancies in fertility levels among regions. The total fertility rate is nearly four children (3.65) for women living in Eastern region, and decreases to around two children (1.86) in the Central Anatolia (HUIPS, 2004). The economic development witnessed in the last decades has had a considerable impact on the decline. However, the effect of economic development can be considered as an indirect effect. The overall fertility decline is primarily associated with the proximate determinants of fertility. These proximate determinants were developed by Bongaarts (1978) and later

---

<sup>1</sup> Total fertility rate can be defined as the average number of children a women would have if she lived through her entire reproductive period and was subject to a given set of age-specific fertility rates (HUIPS, 1999).

elaborated by Bongaarts and Potter (1983). The framework shows that group variation in fertility is due to four main factors: the proportion of married women, the practice of contraception, induced abortion, and the period of lactation infecundability. Further, the model has quantified the contribution of these four factors to the observed level of fertility.

Although the knowledge of family planning methods is widespread with almost 99.5 percent of currently married women being able to name a family planning method, only 42.5 percent are observed to be using modern family planning methods, and an additional 28.5 percent rely on traditional methods, mainly withdrawal (HUIPS, 2004).

The main purpose of this study is to portray the reflection of family planning news in Turkish Printed Media. In the 21<sup>st</sup> century, the mass media have an important role in the formation of modern society as the main channel of communication. The population rely on news media as one of the main sources of information and as the basis on which they form their opinions and decisions. Rogers (1960) explains the contribution of communications media to awareness creation and the adoption of new opinions. The spread of the rise of independent press and increasing literacy rates in many countries offer new opportunities for family planning or health-care organizations to inform the public and reach opinion leaders (Piotrow et.al., 1994).

Seale (2002) focuses on the importance of health messages in the popular mass media in terms of the audience's perception of health, illness and health care, bringing together 'the latest thinking in the field of media studies and the sociology of health and illness'. Demographers also believe that the dissemination of information, training, and communication can change couples' reproductive behaviors (Bongaarts et. al., 1990). To be specific, exposure to family planning messages in television, radio, and newspapers is an important factor in shaping individuals' reproductive attitudes and behaviors (Sharan & Valente, 2002; Olenick, 2000).

One of the main research areas in the media studies is the analysis of the interpretation of different questions in media. In a majority of these studies, the attitude of the media to the question is cross-examined. Additionally, the main target of this study is to explicate family planning news in printed media and make a contribution to the related literature. In Turkey, there are 41<sup>2</sup> national daily newspapers published between 2001-2005, reaching millions of people everyday. The reach of national dailies figure is now estimated to be 4.8 million according to the latest circulation data<sup>3</sup>. According to the results of Turkish Press Readership Research conducted by BİAK (Press Audit Research Council) in 2001, 32.7 percent of regular newspaper readers are women while 67.3 percent are men. As for the education level, primary school graduates constitute the majority of regular readers with 37.3 percent, followed by high school graduates with 26.4 percent and secondary school graduates with 18.0 percent. The proportion of uneducated – only literate readers of newspaper declines to 2.2 percent (BİAK, 2001).

“Family Planning” is a problematic area of debate for some sections in Turkish society due to religion, customs and beliefs, and different views towards population size. Beside the efforts of family planning programs and projects conducted in the related subject by the civil society organisations, information and messages given by the media are important for people who need information and it is also central for the formation of public opinion. Therefore, it is aimed to uncover the help of media in promoting modern contraceptive methods, or its negative effects in some parts. In late 1987, the Turkish Family Health and Planning Foundation initiated a project with Johns Hopkins University's Population Communication Services with the objective

<sup>3</sup> Current YAYSAT A.Ş. and BBD data for the week of 26 September - 02 October 2005.

of conducting a national family planning campaign. The extensive reach of television and radio in Turkey made it possible to concentrate interest on the campaign through the broadcast media. The campaign was designed to promote the idea of family planning, the use of modern contraceptive methods, and the use of family planning service facilities, and it was broadcast in the official state channel, Turkish Radio and Television (TRT) in the period of October-December 1988 (Kincaid, 1993).

Content analysis has been adopted as the analysis method in this study. According to Weber (1990), content analysis is a research method that uses a set of procedures to make valid inferences from texts. These inferences are about the sender(s) of the message, the message itself, and the audience of the message.

In order to examine media reflection of the issue of “Family Planning”, which will be beneficial at this point, the study involves both quantitative and qualitative analyses of the news/columns about family planning; analyses comparing and contrasting the presentation of subjects and sub-subjects, appearance of concepts, messages, quotations and visual materials. Besides, the findings will be evaluated in cross analyses of newspapers from different ideological perspectives in terms of their approaches and arguments towards the concept of family planning. These newspapers have been selected to represent different tendencies of the general audience in Turkey. There were three main objectives and criteria in selecting the newspapers that would be included in the study. The first selection criterion was the circulation figure because some newspapers like *Posta*, *Hürriyet* and *Sabah* are having higher voices in Turkey due to their reach to the readers in greater volumes. The second dimension was to project the differences between the perspectives of leftist-rightist wings towards the family planning subject, as exemplified by *Zaman* and *Cumhuriyet*. The third objective was to discover the approach of newspapers based on nationalist tendencies such as *Ortadoğu* and *Özgür Gündem*. All of the news/columns of selected newspapers, i.e. *Posta*,

*Hürriyet, Sabah, Zaman, Cumhuriyet, Ortadoğu* and *Özgür Gündem*, were included as the universe within the time period of 2001-2005.

The year 2003 has been determined as the reference point considering the recent Turkey Demographic and Health Survey (TDHS-2003), which has been conducted by the Hacettepe University Institute of Population Studies (HUIPS) in that year. The significance of this survey is that it provides demographic and health indicators needed to obtain the recent demographic profile of the country. TDHS-2003 is the latest of similar studies and surveys carried out by HUIPS within the last 40 years.

The sampling of TDHS-2003, conducted with a representative sample of all groups in Turkey to collect data on issues like the level of and change in fertility, infant and child mortality, family planning, and maternal and child health, was designed to provide demographic and health indicators for urban and rural areas for the entire country. Detailed information was collected from a sample of married women between the ages of 15-49. The results of this survey are beneficial for the establishment of new strategies to improve family planning and health services in Turkey. The TDHS-2003 is still the most important source of data in question. In this study, accepting TDHS as the reference point, the period of two years prior to the survey is compared with the period of two years following the survey. As regards the focus point of this study, the TDHS-2003 includes information about the family planning methods or ways that women have heard, methods being used or preferred to be used, the reason of not using a method of contraception to avoid pregnancy, and the knowledge of women as to whether they are informed about any place to get a method.

The purposes of this study are,

1. To describe the approach of the Turkish print media towards family planning issues by making comprehensive analyses among different newspapers.
2. To determine the ideological viewpoints of different newspapers, their arguments and efforts towards family planning issue by making qualitative and quantitative analyses of the news/articles in the media through a comparison of the periods of time.

The assumptions of the study are directed to uncovering the approach of Turkish media towards family planning issues. The hypotheses targeted to be tested are as follows:

1. The proportion of articles to inform people about the family planning issue is limited.
2. The news and articles are mostly dealing with presenting activities rather than giving information to the readers.
3. The news and articles in Turkish media concerning family planning issues have contradictional statements compared to each other.
4. The content of the news and columns about family planning is under the influence of different political lines represented by the media.

This thesis aims to elaborate the approach of printed media towards family planning methods and practices as well as family planning programs in Turkey. For arriving at such kind of an analysis, the study first discusses media and how it influences the masses, and the fertility behaviour in Turkey and how it has changed over time. After a brief introduction mentioning these issues, the second chapter of the study, the Literature Survey, covers a wide

range of topics beginning with Demographic Transition and Turkey, and Family Planning in Turkey, followed by a discussion of the impact of media upon family planning programs and the dissemination of messages concerning family planning. The third chapter, the Conceptual Framework, discusses the influence of media on the society from various perspectives.

The Content Analysis Method is used as the methodology of the study. As explained in the fourth chapter, the study depends on the news/columns including the keywords of “Family Planning” and “Birth Control” published in 7 newspapers between the years 2001-2005. These seven newspapers, selected on the basis of circulation figures as well as their leftist/rightist and nationalist and ethnic perspective, constitute the sample of the study. In the fifth chapter, all of the 1290 news covered in the study are analyzed both quantitatively and qualitatively. All findings have finally been discussed in the Conclusion chapter.

## **2. LITERATURE SURVEY**

### **2.1. Demographic Transition and Turkey**

The developing countries witnessed a reproductive revolution since the mid 1960s. The change is widespread as it affected all developing countries irrespective of cultural, political and socio-economic circumstances (Robey, Rutstein and Morris, 1993)

The demographic transition theory takes into account the changes in demographic components of the societies as they evolve from traditional to modern stages. Here, the traditional stage refers to equilibrium with high levels of fertility and mortality and modern stage refers to a level of development with low mortality and fertility. The transition has been defined as the process of adjusting demographic variables through a new equilibrium. The theory based on actual historical observation over the European populations was developed with the contribution of many demographers and its tenets were presented by Notestein (1953, cited in: Alvarado and Creedy, 1998).

Notestein (1945, cited in: Crenshaw, 2000) describes the scene before the demographic transition occurs and the conditions preparing the grounds for this transition. He argues that a transitional stage of rapid population growth occurs due to rapid decline in mortality due to modernization and a slow decline in fertility due to slowly changing social patterns. This transitional stage is completed whenever social change is attained towards the erosion of social norms and regulations promoting pronatalism. This social change is almost totally generated by industrialism, urbanization and individualism. Davis (1963, cited in Crenshaw, 2000), focuses on the choice of households toward upward social mobility rather than having more children in view of the reducing mortality. That is, compared to broad macro-social changes coming together with urbanization and industrialization, micro level

determinants also account for the transition process. Szreter (1993) also highlights the impact of individual level or household level factors.

The general arguments around the issue of fertility decline are the issue of macro level analysis concerning aggregate changes like industrialization and urbanization. Like Szreter (1993) and Davis (1963), Shorter and Angin (1996) elaborates the issue from a more individualistic point of view. Rather than these macro actors, their work presents how decisions as to reproduction are formed by the daily acts and perceptions of individuals. Within this frame, Shorter and Angin (1996) focuses on the life practices of men and women before and after marriage in Turkey and the process of negotiation between these two actors. Making use of an ethnographic methodology, they argue that macro level analysis of demographic transition cannot fully interpret the phenomenon and people make their own valuations as to their values, their goals and to have a child or not. The article concludes that no unique characterization has applied for individuals and families in Turkey throughout the course of fertility decline.

Behar (1995) considers the Turkish experience of fertility decline as a classical demographic transition. For the fertility decline, he proposes a demand-supply model such that factors associated with demand for fertility control brought about the demographic transition in Turkey. He argues that social factors such as increased social status of women and resulting improved health and education of children were major reasons behind the transition. The change in the status of women resulted in greater autonomy of women in the household and in social life and this, in turn, resulted in decreases in sizes of households.

The global demographic figures show that societies pass to the stage of equilibrium at various periods and paces. In fact, the stage that Europe's populations are currently in is defined as new demographic transition referred as the second demographic transition. The basic feature of the new

equilibrium observed in European countries is the decline in fertility level to a level around replacement fertility level that is 2.1 births per woman. This means that these populations will stay in a stationary balance in the long run.

The figures obtained from the TDHS-2003 show that Turkey has reached the later stages of the demographic transition with a current fertility level close to reproduction level as measured by the total fertility rate (TFR). In fact, the transition can be clearly observed through the decades since the second half of the twentieth century. The surveys that were held every five years since 1963 show that great declines have occurred in the overall fertility level. From the 1970s to the early 2000s, the total fertility rate declined by more than one half, from 5 to 2.2. This trend of declining fertility has been argued to be the last phase of demographic transition for Turkey. It has been estimated that the country's population will be around 95 million by the mid twenty-first century with no major increase or downfall (SIS, 1995 cited in Yavuz, 2005.)

Bongaarts (1983) proposes a model for the factors affecting the fertility control. The model includes four intermediate variables as factors controlling fertility. These factors are delay of marriage, the use of contraception, induced abortion and postpartum infecundability. Bongaarts (1983) states that as a population moves through the transition process from natural to controlled fertility, an increase is observed in deliberate marital fertility control. This control reflects itself in the increase in contraceptive use and also in the practice of induced abortion. Along with the increase in deliberate control of marital fertility changes are observed in other principal intermediate variables, marriage and postpartum infecundability. As a consequence of these trends, significant changes occur in the level of marital and overall fertility. However, these factors exhibit variations depending on whether the countries completed fertility transition or at earlier stages.

Another view on efforts for increased use of family planning services is interpreted as a new form of Malthusianism and criticized heavily. The

ideology first proposed by Thomas Malthus in late 18th century concerning the rise of population as the main cause of all social problems -such as poverty and hunger- seems to be popular again as global problems became worse. Bandarage (1994) draws attention to the intensifying focus of international scientific environment and health institutions on this approach considering fertility control as the solution to all global problems. However, Bandarage also cautions against the forms of family planning that develop as external domination over women's reproductive choices such as the experiments of contraceptive methods on poor women of Third World without consent, stressing the direct relation between fertility control and women's rights and arguing that family planning should be basically in a form to support individual's empowerment.

## **2.2. Family Planning in Turkey**

The main policy of the governments in Turkey between 1923 and 1965 was to increase the population growth rate. Main reasons of this policy were the insufficient labour force, need for defence force, and the high death rates among infants and children. A number of laws of regulation have been put into effect to stimulate the birth rates, directly and indirectly.

However with the 1950's the high population growth rates caused an increase in urbanization. With the application of Law no 557 in 1965, the right of family planning was released. According to this law, importing birth control methods, supporting the health education of couples, and conducting free of charge birth control services in public health organizations were permitted (Güngördü, 2003; HUIPS, 2004).

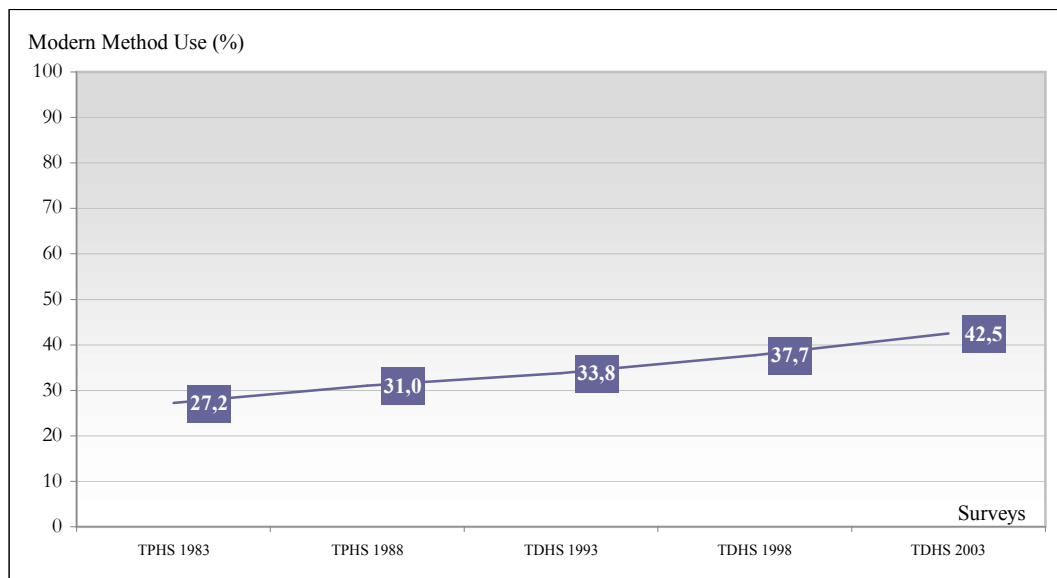

In the second law about the regulation of family planning services (No 2827, year 1983), which is more detailed than the former law, the necessity of cooperation between the public and private sectors has been emphasized.

There are also many amendments with this law, such as application that permits educated midwives and nurses to insert intra uterine devices (IUD), allowance of surgical contraception methods, permission to terminate the pregnancy within the first 10 weeks, and the obligation of cooperation between the sectors (Güngördü, 2003; HUIPS, 2004).

Today, family planning services can be obtained from public and private sector. Using modern methods are not always common in respect of service attainability, prevalence and variety throughout the country. There are important differences among regions, education levels and residential conditions as it has been in the other health service indicators.

Family planning methods are known by the couples. According to the results of TDHS-2003, 99.5 percent of ever-married and currently-married women declared that they have heard at least one modern family planning method. 86.2 percent of all married women knew at least one method according to the TDHS 1978. On the other side, this ratio was 99.5 percent in TDHS 2003. According to TDHS 1998, 97.1 percent of all husbands knew at least one modern method.

**Figure 2.1. Percentage of Women by Modern Contraceptive Method Use in Turkey (1983 – 2003)**

On the other hand, when the percent of women using modern contraceptives is taken into account, a contradictory view is obtained. According to the results of TDHS-2003, only 42.5 percent of currently married women use one of the modern contraceptive methods either to space or to limit their pregnancies (Figure 1). The current percent of modern contraceptive use among married women, 42.5 percent, is quite high compared to the figure obtained from the previous survey, TDHS-1998. The prior figure, 37.7 percent, reflects the significant increase over the five years, from 1998 to 2003. Nonetheless, the discrepancy between the level of knowledge and level of use still needs to be explored. And, clearly there is need for more initiatives, family planning programs, etc. for the elimination of the uncovered need.

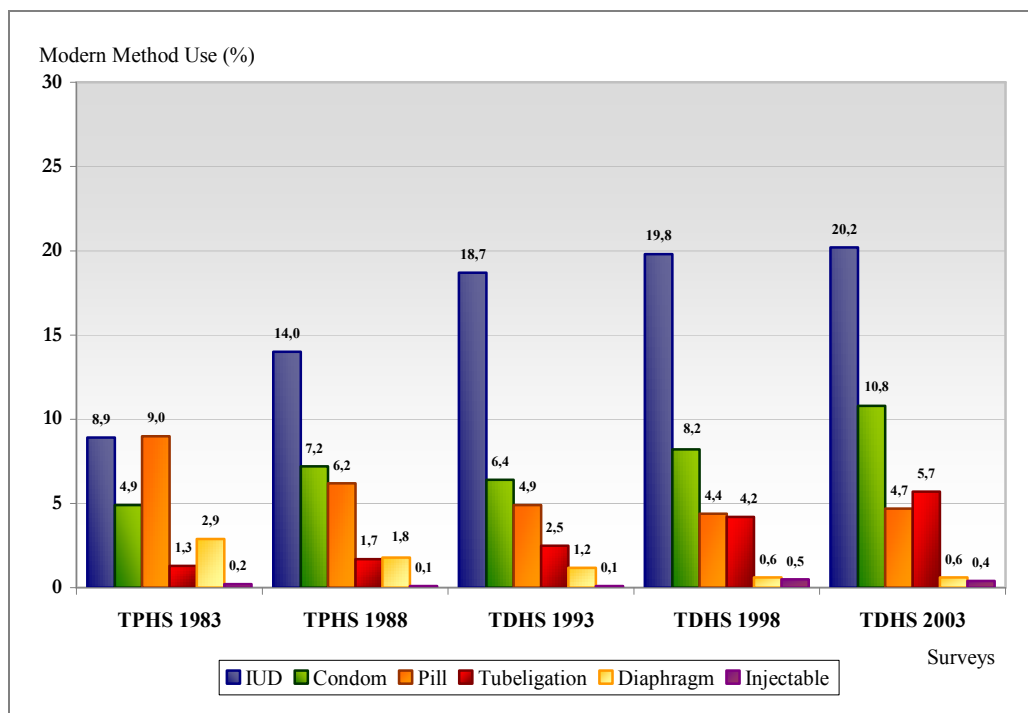

**Table 2.1. Percentage Distribution of Women by Type of Contraceptive Method Used in Turkey (1983 – 2003)**

Contraceptive Use	Years				
	TPHS 1983	TPHS 1988	TDHS 1993	TDHS 1998	TDHS 2003
IUD	8.9	14.0	18.7	19.8	20.2
Condom	4.9	7.2	6.4	8.2	10.8
Pill	9.0	6.2	4.9	4.4	4.7
Tube ligation	1.3	1.7	2.5	4.2	5.7
Diaphragm	2.9	1.8	1.2	0.6	0.6
Injectable	0.2	0.1	0.1	0.5	0.4
Vasectomy	-	0.1	0.0	0.0	0.1
<b>Any Modern Method</b>	<b>27.2</b>	<b>31.0</b>	<b>33.8</b>	<b>37.7</b>	<b>42.5</b>
Withdrawal	30.1	25.7	26.2	24.4	26.4
Calendar	1.4	3.5	1.0	1.1	1.1
Other	2.7	3.1	0.9	0.6	1.0
<b>Any Traditional Method</b>	<b>34.2</b>	<b>32.3</b>	<b>28.1</b>	<b>26.1</b>	<b>28.5</b>
Not Using Any Method	<b>38.5</b>	<b>36.6</b>	<b>37.4</b>	<b>36.1</b>	<b>29.0</b>
<b>Total</b>	<b>100.0</b>	<b>100.0</b>	<b>100.0</b>	<b>100.0</b>	<b>100.0</b>

Significant increase in usage during these years are the increase in the prevalence of modern contraceptive use. The prevalence of modern contraceptive use was 27.2 percent in 1983 whereas it has increased to 42.5 percent in 2003. The prevalence of modern contraceptive use was higher than the traditional contraceptive use in 1993 for the first time.

The most widely used modern method has been the IUD in all surveys during the last 20 years. The increase in IUD use prevalence from 8.9 percent in 1983 to 20.2 percent in 2003 is noteworthy and could be considered as a result of the promotion efforts for modern contraceptive use. Usages of IUD, tubal ligation and condom have increased between 1983 and 2003. On the other hand, percentage of women using pill decreased from 9 to 4.7 percent.

**Figure 2.2** *Percentage Distribution of Change in the Modern Contraceptive Methods by Type of Method in Turkey (1983 - 2003)*

### **2.3. The Media and Family Planning Programs in the World**

Family planning programs have contributed to the women by helping them prevent unwanted pregnancies. It is a fact that fertility levels are falling in developing countries primarily depending on increasing percentages of married women using effective family planning methods.

When it is aimed to widen the use of modern contraceptive methods, there is need for building better relations with media and making use of media in addition to existing public institutions and NGOs initiatives to help women reach family planning methods and services. Professionals in the area may reach large numbers of women through family planning programs. Today, media reaches more people than ever before. As several international studies have found women who watch more family planning messages on television, radio, and print media are more likely than those who see fewer messages to use contraceptives (Keller and Brown, 2002).

The International Planned Parenthood Federation (IPPF) urged family planning programs to pay regular attention to providing information to journalists in addition to films, radio spots, advertisements and other mediums of communication (IPPF, 1992).

There are also some examples on media researches about evaluating the effects of informing campaigns. There is understandably a strong interest within population policy and family planning program circles in the potential impact on contraceptive behavior. The reproductive preferences of mass media messages try to inform and motivate people on the methods and advantages of regulating fertility.

Analyses of data from the 1998 Kenya Demographic and Health Survey demonstrate a strong statistical association between women's reports of having heard or seen messages about family planning through various media

outlets and their use of contraceptives and their reproductive preferences. While 15 percent of women who say they have neither seen nor heard media messages on family planning are currently using a contraceptive method, this proportion rises to 25 percent among those who have heard radio messages, to 40 percent among those exposed to both radio and print messages and to 50 percent among those exposed to radio, print and television messages. Given the persistence of these strong relationships, the results suggest that the mass media can have an important effect on reproductive behavior (Westoff and Rodriguez, 1995).

Nigeria is a well recognized economic and political force in Africa, and it is the most populous nation on the African continent. Between 1985 and 1988, well designed mass media campaigns have proved their ability to increase the use of family planning in Nigeria. DHS data from Nigeria report similar findings for Kenya. The 1990 survey found that use of contraceptives was 8.2 percent points higher among women who were exposed to family planning messages than among their unexposed counterparts. The gap was even greater, 10 percent, for current use of contraceptives. As nonusers, 37 percent of those exposed to family planning messages said that they intended to use contraceptives, compared with only 19 percent of nonusers who had not seen or heard the messages (Kiragu, 1996).

Another African country, Ghana's fertility decline has coincided with an increase in the percentage of women of reproductive age reporting exposure to family planning messages via the media, a rise in the education of women of reproductive age, and a decline in under five mortality. According to 1998 Ghana Demographic and Health Survey, the percentage of women who heard family planning messages via the radio increased from 35 in 1993 to 51 in 1998, whilst the percentage who had seen family planning messages of television rose from 22 in 1993 to 34 in 1998. The 1998 Ghana DHS found that 11 percent of women had read a family planning message in a newspaper or magazine. The results show exposure to family planning messages through

mass media substantially increase use of modern contraception in Ghana (Parr, 2001).

Family planning communication campaigns have been shown to increase contraceptive use also in Tanzania. Between April 1993 and October 1994, family planning messages were disseminated through the mass media. The 1994 Tanzania Knowledge, Attitudes and Practice Survey was designed to assess changes in health and family planning since the 1991-1992 Tanzania Demographic and Health Survey. Total contraceptive prevalence in Tanzania in 1991-1992, before the national media campaign began the modern method prevalence was only 6 percent. Interestingly, by 1994, current use of modern methods was far greater among women who recalled family planning messages than among those who did not. As a result, the prevalence of modern contraceptive use increased to 11.2 percent in 1994 (Jato et. al., 1999).

Exposure to family planning messages in the mass media was the most important determinant of women's knowledge of contraceptives, even more important than education level or residence, analysis of DHS data found in Egypt (Bhushan, 1995) A strong mass media public information and education program conducted by the State Information Service has been one of the main components of the Egyptian family planning program since the mid-1980s. After focusing initially on general "population awareness" messages, the education and communication effort has increasingly moved to providing more specific advice and information on family planning. In 2005, Egypt Demographic and Health Survey obtained information on the types of media through which women received any family planning information (Zanaty, 2006).

Giving an example from Asia, Bhandari and Shrestha (2005) examined the effects of exposure to family planning programming in audio, visual, and audio-visual mass media on shaping individual contraceptive attitudes and

behaviors in Nepal. They further investigated whether the effects vary by gender. The results of analyses that included both men and women indicated that the exposure to audio media was important in shaping contraceptive attitudes and that the exposure to audio-visual media was important in shaping contraceptive practice. However, the results of a gender disaggregated analysis revealed that the effectiveness of media exposure differed between men and women. While the exposure to audio media (radio) was important among men in shaping their contraceptive attitudes, the exposure to audio-visual media (television, movies) was important for women. But the exposure to audio-visual media was important among men in shaping their contraceptive behaviors, whereas none of the media were found to be important for effecting contraceptive practice among women.

Another study from Bangladesh showed that radio had been playing a significant role in spreading family planning messages among eligible clients; 38% of women with access to a radio had heard of family planning messages while the figures for TV and newspaper were 18.5% and 8.5% respectively. Besides, some factors like education, number of living children and current contraceptive use were important predictors of exposure to any mass media family planning messages (Kabir and Islam, 2000).

Exposure to general media programming and to family planning messages through the media has a strong impact on reproductive attitudes and behaviors in Pakistan and India according to the results of Olenick's (2000) study. A study in Pakistan in the years 1994-1995 has revealed that 45 percent of women exposed to all three forms of media were using a contraceptive method, compared with 31% of women exposed to two types of media and 9% of women exposed to no media. Further, media exposure increased the likelihood that women not currently practicing contraception planned to use a method in the future. 58% of women exposed to three forms of media in 1994-1995 said that they would practice contraception in the future while 52 percent of women exposed to family planning messages on both the radio and

television reported that they intended to use contraceptives. Additionally, women's knowledge as to modern contraceptive methods was also observed to be higher in line with their regular exposure to type of media (Olenick, 2000). According to another case study in India in 1992-1993, exposure to television proved to be influential on family planning decisions and behaviours, while a significant association was not observed through listening to the radio. Since exposure to media varied according to state of residence in India, so did the rates of contraceptive use: The proportion of women exposed to television at least once a week ranged from 13% in Bihar to 83% in Delhi; current contraceptive use was highest in Kerala (63%) and Delhi (60%), and lowest in Nagaland (13%) and Bihar (23%). Exposure to media was found to be associated with women's approval of family planning, discussion of family planning with their husbands, use of a method, and intent of bearing no more children (Olenick, 2000).

### **2.3. The Media and Family Planning Program in Turkey**

A mass media campaign concerning family planning was conducted in Turkey in the period of October and December 1988. The alliances of the work were The Turkish Family Health and Planning Foundation (TFHP); Turkish Radio and Television (TRT); Turkish Ministry of Health and Social Services; Zet Market Research Services and USIAD. The project was subjected to generate broad support for the national family planning campaign within the government and among other key opinion leaders and decision makers and to promote discussion about family planning and family size between spouses (JHCCP, 1997).

The Mass Media Family Planning Campaign in Turkey was designed to promote family planning, the use of modern contraceptive methods, and the use of family planning service facilities. The campaign was targeted at men in

urban and rural areas and married women ages 15 to 44. Opinion leaders and decision makers were also an important target audience because their support was crucial to the success of the program. The campaign was launched with a population symposium attended by 600 high-ranking government officials, health and other professionals, and media representatives. The symposium sensitized the influential masses to the population problem and increased their support for family planning. The symposium received intensive media coverage and led to several weeks of media attention to population issues. “A Child is Crying”, a 26-minute documentary aimed primarily at opinion leaders and decision makers, described the consequences of rapid population growth (JHCCP, 1997).

Given the impact of television in Turkey and the widespread exposure of the target audience to the medium, it was decided that television would play a central role in the campaign. In one television spot, a poor urban father is shown teaching his children to peddle odds and ends on the streets to help the family make ends meet. In another television spot, a villager is shown dividing the family land among his five sons. The family had so many children over the years that the land left to be divided among the children fit into a flower pot (JHCCP, 1997).

Then to uncover results of the campaign, a research set was conducted with baseline surveys, focus group studies, in-depth interviews, review of clinic records and cost analysis (JHCCP, 1997). As a result of this 3-month national family planning campaign in Turkey, it was seen that 63% of women encouraged talking to their husbands about family planning issues. In the urban areas studies, use of modern contraceptives increased from 39% to 43% immediately afterwards and shifted toward more effective methods. The most remarkable behavioral change was the apparent shift from oral pill and condom use to the use of intrauterine devices. The national campaign had a particularly strong effect on women with more years of formal education. (Kincaid, 1993).

#### **2.4. The Media and Family Planning Messages in Turkey**

In Turkey, radio and television are major potential sources of information about family planning. To assess the effectiveness of these electronic media for the dissemination of family planning information, all women and husbands in TDHS- 1998 were asked if they had heard messages about family planning in mass media during the last few months preceding the survey.

TDHS 1998 shows that around half of all women and husbands reported that they had heard or seen family planning message on radio or television. Overall, family planning messages are seen more often on television rather than heard on radio. 38 percent of all women and 36.8 percent of all men told that they saw family planning messages only on TV. The differences in the percentages that had seen a message by type of place of residence, region and education are greater for women than men.

Women were asked if they had been exposed to a family planning message through a newspaper/magazine article, a poster, or a leaflet/brochure during the few months prior to interview. In TDHS 1998, 27 percent of women interviewed reported that they had exposed to at least one of these media that contained family planning information. The most commonly reported source was newspaper/magazine (19 percent). 23.1 percent of women in the urban areas and 11.2 percent of those in rural areas had seen a message about family planning through newspaper/magazine. The discrepancy among regions is also striking. While 23.9 of women in the Western regions came across with a written message, this rate declines to 12.9 percent in Eastern regions. More educated women were more likely to have been exposed to print media on family planning messages. This proportion was 22.9 percent for women educated in the secondary school and higher, while it declined till 3.2 percent for women who had not graduated from primary school or had not received

education at all. The women between the ages of 20-24 were the highest ranking group in exposure to family planning messages in the print media with 13.6 percent while the least exposed group was those between the ages of 45-49 with 6.1 percent (HUIPS, 1999).

Compared to women, men were exposed to written message in print media with 46.4 percent, the proportion of men who saw these messages in newspapers/magazines was 38.4 percent. This rate was 43.1 percent in urban areas while it declines till 28.3 in rural areas. Just like in the case of women, men living in Western regions were exposed to messages more than (44.3 percent) those living in the Eastern regions (28.6 percent). This proportion rose up to 52.6 percent for men educated in the secondary school and higher, while it was 14.9 percent for men who had not graduated from primary school or had not received education at all. It was also estimated in the research that men between the ages of 20-24 were exposed to family planning messages with 42.9 percent while those between the ages of 45-49 were exposed to the messages with 28.8 percent (HUIPS, 1999).

There are no available data in TDHS 2003 about the observation of family planning messages in media. In the preparing period of the questionnaire on TDHS 2003, questions asking for the query of family planning messages to the women. In-depth interviews, women asked for “detailed” television programs and more frequent news on newspapers about family planning (HUIPS, 2003).

According to the in depth interview, before marriage most of the women have very little information about family planning. Most of these information were provided by close relatives, (such as sister, sister-in-law), friends, books and other published media. Television is one of the most important information queries beside family and friends. Especially in conservative families, in which talking about sexuality is not common, the only query of information about these subjects is television programs for young girls as well for the

married women in villages (Morning programs, news, health programs etc.). Women emphasize that all these subjects were shown on TV, that even a small child could talk about them (HUIPS, 2003).

### **3. CONCEPTUAL FRAMEWORK**

#### **3.1. Media and Society**

The effects and influences of the mass media on the society started being researched in the 1930s; yet, theories or beliefs date back to the late nineteenth century. Those years were accepted as the first in the area of or notion of mass media's effects on the societal attitudes and beliefs. Katz, Berelson, and Lazarsfeld in 1941 decided to research the issue that is now commonly known as 'Minimum Effects Model'. The main subject of this research was to discover factors which are influencing voting behavior. And the finding was that the mass media played little or no part in the process of the formation of any political opinion, attitude or preference. The researchers came to the conclusion that the biggest factor influencing people's political attitudes was other people but not the media (Wright, 2005).

By the 1960s, there was a revival of Marxist attitudes. Parallel to this, the work of Katz, Lazarsfeld, and Berelson were largely dismissed in favor of re-examining the model of research into media effects, because of the innovations in the mass media sector after the 1941 period, to consider another way in which to investigate the influence and the effects of the media (Wright, 2005).

Curran and Gurevitch (2000) underline the need for and importance of defining influence as we understand it in relation to society and its overall effect. Drawing attention to the society's perception of the concept of influence as an 'external force', they also describe the forces of influence as circumstantial and directed, for example "uses and gratifications", which state perspectives, interpretations, and measurements. Including the concept of social belonging and audience's being deceived into believing, the theory of uses and gratifications is based on the active use and consumption of the media by individuals in order to meet certain needs and as a tool of

subliminal persuasion. According to Curran and Gurevitch (2000), the need to gratify its audience with the follow of an idealistic social fulfillment provides the media the opportunity to convey subliminal messages that may influence people's opinions, interpretations and understanding of societal factors.

The emergence of the mass media has changed the ways in which culture is transmitted in society. Furthermore, today's mass media are able to provide information to potentially vast audiences, its role in the transmission of culture is increasingly important. The mass media – television, radio, newspapers, magazines, books, movies - transmit cultural messages in the form and content of its news or entertainment messages (Cockerham, 1994).

Although the degree and direction are still debated, it is widely accepted almost without rejection that mass media is one of the most efficient factors and among the most effective instruments in the construction and circulation of social understanding, influence and social imagery in modern societies (Wright, 2005).

Media revolved and became one of the most important societal actors together with the new developments in technology which benefited communication organs. Parallel to these development-stages; media elites like media managers, editors and columnists became major group within the societal structure (Astiz, 1969). Media, with this gained power, got the most effective methods and tools which both affect and change people's acts and attitudes. This effect is not limited with individuals, it can be observed on the societal basis. Media has the power of rebuilding, reshaping and interpreting society's structure and relations of individuals in the society. Signs, constituted by symbols, numbers, words and pictures, do not only transmit messages but also interpret and reshape people's world. Rebuilding and changing characteristics of the media is not limited with individuals and society, it also scopes political leaders who are effective in the society and the politic arena and policies of the legal governments (Rivers, 1982).

Surely, no one disclaims the importance of the media services for individuals and society's communication needs. Still nevertheless, there is another side that the media servicing to human can also be used as propaganda tool for brainwashing if wanted. The owners of the media can deform and change news, signs in the direction of their expediency. Thus, these media holder groups can desire the monopoly of faculty of shaping people's thoughts and way-of-thinking. Again the media can be used for cultural colonialism and assimilation. Beyond this, media has the potential of being used by some power for deadening national identity, weakening notions of national unity, disturbing societal peace and drifting society into chaos and confusion. On the other hand, Milliband and some researchers argue that media's leading function in the capitalist societies is to legalize the government; moreover, is to illegalize opposite groups (Arslan, 2004).

The most considerable representative of the structuralist approach, Althusser rejects self-explanation of personal behaviours and opinions, and regards media as one of the ideological instruments of the state dressing individuals an identity which transforms them into culture-product objects and which builds their perception of the reality (Tılıç, 1998).

As Curran and his friends summarized (Barrett and Braham, 1995), researches found these main conclusions: The use of advanced technology in media gave the opportunity of wide-area-networks which enabled access to larger masses. Additionally, urban people lost rural characteristics after rapid changes in the age of urbanization and industrialization. As the rural life style was observed to be more stable, decisive and balanced compared to the urban life, urban people became defenseless, irremediable and easily open to affects. Furthermore, rapid urbanization and industrialization created anomic and alienated societies with the feelings of emptiness - meaningless - valuelessness and having protest tendencies, which made these people open to

be easy manipulation. Besides, media played a pioneer role during the 1st World War in brainwashing of larger masses and in the rise of fascism.

It is a fact that media is effecting people, yet, some researches like Katz and Lazarsfeld (1955, cited in: Barrett and Braham, 1995) stated there can not be a standard affect and the degree of affect is related with factors like age, sex, education of individuals. Especially, there is antisymmetry between social status and media effect. Individuals who belong to a higher social status are being less affected than the lower ones.

There are 2 views which are opposite to each other concerning societal effect of the media:

1. Media is a passive transmitter. In other words, it has a passive role in sending messages.
2. Media is an active intervener. It has an active role in shaping messages.

According to the first view, media is a mirror which reflects the truth as its natural case. Objectivity and neutrality is the main principle of professional the ideology of the media (Barrett and Braham, 1995).

On the other hand, the Marxist approach evaluates media differently against pluralist views, Marxist researchers state that media distorts objective truth. They argue that media can not be unbiased; because, elites of the society have affective power on media. Generally, media and its products also are embodied by economic and politically dominant groups who determine individuals' and societies' destiny (Barrett and Braham, 1995).

From these debates, in this study, my approach was that there are different political lines in Turkey operating to hold authority. These powers always

need or use or found strategic alliances with media. That is to say, Turkish media are divided on the basis of certain motives and purposes; media institutions happen to voice some ideas that they adhere, but do not focus on the core task of giving information. Thus, health issues like family planning are not among the pioneer and leading subject issues of the media, which paves the way for appearance of unconscious news and columns or an incoherent line towards the issue resulting from this unconcerned attitude of the media.

## 4. METHODOLOGY

### 4.1. Source of Data

Within the historical development of the Turkish printed media, the one-party period which lasted till 1946 after the proclamation of the Republic has been a period in which the press published news in line with the ideological motives of the state, and the dissident press was completely silenced. The multiparty era, on the other hand, has been a period witnessing freedom of press compared to the single-party period. Yet, also in this period, the press continued to be governed by the state or by a small minority, rather than the people. In the multiparty era, the Turkish press has discovered the way of making money from the advertisement cake enlarging in parallel with the economic improvement in the country and from the journalism born out of advancing technology. These processes led to consolidation in the media and to the entrance of capital holders involved in other fields of business into the media sector. The proprietorship structure in the media has evolved into a rather different form than the previous periods. The capital, taking cognizance of the power of media, began to participate in the media sector in person instead of exerting influence over media as outsider (Özdemir, 2002).

According to Görgülü (1991), big capital groups' exercise of direct control over media in Turkey has come on the scene in two ways.

1. Existing press enterprises grew and expanded, turning into "press group" in time. They engaged in businesses out of media sector in this process, which provided them with interests in various fields of business, and raised them to the position of holding the economic power sufficient to sustain their publishing activities and to issue new publications.

2. Surviving newspaper could not stand against increasing costs and economic hardships, and were sold to capital groups newly entering into the media market. Press enterprises changed hands in this way.

In both ways, the media field was being taken under control of big capital groups, which in turn accelerated 'monopolization' (Görgülü, 1991).

In Turkey, there are two important media groups. One of these groups is *Doğan* Media Group. Taking its roots on May 3, 1950 with *Milliyet*, founded by *Ali Naci Karacan* and publishing *Hürriyet* in the 1990s, the group became a huge media group. On the other hand, *Merkez* group with *Sabah* and other widely acknowledged newspapers and magazines is the other strong media group. In addition to those two groups, *İhlas* (*İhlas holding / Enver Ören*), *Akşam* (*Çukurova Holding / Mehmet Emin Karamehmet*) and *Doğuş* (*Doğuş Holding / Ferit Şahenk*) are also among the groups with well-known media initiatives (Doğan, 2005).

There are 41 daily national newspapers published between 2001-2005 reaching millions of people everyday in Turkey. When the circulation figures of the year 2005 is analyzed, it is seen that *Posta*, *Zaman*, *Hürriyet*, *Sabah* and *Takvim* are the best selling newspapers in respective order<sup>4</sup> (See Table 4.1)

---

<sup>4</sup> Current YAYSAT A.Ş. and BBD data for the week of 26 September - 02 October 2005.

**Table 4.1** *Average Daily Circulation of the National Newspapers in 2005*

<b>Number</b>	<b>Newspapers</b>	<b>Circulation</b>
1	Posta	651.232
2	Zaman	526.783
3	Hürriyet	506.770
4	Sabah	433.320
5	Takvim	287.022
6	Milliyet	277.662
7	Vatan	241.568
8	Fanatık	220.756
9	Türkiye	218.856
10	Aksam	194.102
11	Pas Fotomaç	181.798
12	Güneş	136.110
13	Gözcü	133.853
14	Fotospor	128.000
15	Yeni Şafak	123.463
16	Bugün	115.000
17	Star	107.429
18	D.B. Tercüman	102.661
19	Şok	81.500
20	Vakit	67.698
21	Dünya	57.079
22	Yenicağ	56.558
23	Cumhuriyet	56.507
24	Referans	50.650
25	Milli Gazete	48.750
26	Forum Diplomatik	45.000
27	Radikal	40.820
28	Birgün	34.000
29	H.O. Tercüman	33.287
30	Bizim Gazete	20.000
31	Gözlem	19.450
32	Ekonomik Durum	11.500
33	Özgür Gündem	9.250
34	Turkish Daily News	8.716
35	Yeni Asya	8.000
36	Ortadoğu	7.700
37	Günlük Evrensel	6.151
38	Hürses	4.102
39	Star Ekonomi	4.000
40	The New Anatolian	3.500
41	Yeni Mesaj	3.100

In all those newspapers, the keywords “*Family Planning | Birth Control*” were searched and all the news covering the keywords for the years 2001-2005 were brought together under a database. For the analyses, 7 newspapers, i.e. *Posta*, *Sabah*, *Hürriyet*, *Cumhuriyet*, *Zaman*, *Ortadoğu* and *Özgür Gündem* were selected as the sample of the study.

There were three main criteria in selecting newspapers to include into the study. The first was circulation that some newspapers are having huge voices in Turkey according to their reach volume to the readers. The second dimension was to discover differences between left-right views towards the family planning subject. The third criteria were to see nationalist or ethnic based newspapers’ approaches.

*Posta*, *Hürriyet* and *Sabah* were selected because of having higher circulation figures in 2001-2005 periods. *Posta*, *Hürriyet* and *Sabah*, having high circulations in Turkish media and following popular line in their pages, were selected to represent *Doğan* and *Ciner (Merkez)* media groups. *Hürriyet* and *Posta* are the publications of *Doğan Medya* Group, whereas *Sabah* is from the *Merkez* Group headed by *Turgay Ciner*. *Hürriyet*, *Sabah* and *Posta*, have been published since 1948, 1985 and 1995 respectively<sup>5</sup>.

To represent left and right views and approaches towards family planning issue, *Zaman* and *Cumhuriyet* were included to the study. *Cumhuriyet* and *Zaman* were included to the sample because of their different ideological stands. *Cumhuriyet*, which has been published since the year 1924 and being the oldest in Turkey among the current daily newspapers, is well-known for its social democrat position and its commitment to Atatürk’s premises. On the other hand, *Zaman*, which has been published since 1986, reflects a more Islamic view.

---

<sup>5</sup> <http://www.byegm.gov.tr/TURKBASINI/gazete-turkce.htm>

Also, to see different nationalist and ethnic based approach about the studied issue, 2 newspapers, that are *Ortadoğu* –representative of Turkish nationalist views- and *Özgür Gündem* –voice of Kurdish nationalist views- were included to the study. The *Ortadoğu* newspaper, which is close to the nationalist movement party (MHP), has been published since the year 1972. Other, *Özgür Gündem* has had the longest publication of any daily newspaper in Turkey. It was published in Istanbul from 1992 until April 1994, at which point it was closed down. From April 1994 until its closure in February 1995 it was published under the name *Özgür Ülke* (Free Country), from April 1995 until the closing down in August 1995 under the name *Yeni Politika* (New Politics), followed by *Demokrasi* (Democracy), *Ülkede Gündem* (Agenda in the Country) and *Özgür Bakış* (Free View) which closed down in April 2001. The first three versions were distributed both in Turkey and in Europe (Hirschler, 2001).

The News/Columns which were included in the analyses were obtained through the source of Mediaprof®<sup>6</sup> media monitoring database of PRNet Inc.<sup>7</sup>

Two main keywords were selected in this study which are called “*Family Planning | Birth Control*”. The reason of 2 keywords was to reach the whole news / articles. Search string was made with OR combination. That means, each of family planning or birth control related news / articles has been analyzed within the selected newspapers universe. Using the parser software which generates news/columns only once by converting and restructuring files and databases even if more than one keyword appears in a single article, repetition is blocked to ensure that one news / article is not analyzed twice. In the evaluations, “Lore® Data Analysis System v2.5” licensed from Delahaye Medialink USA was used. Data was transferred to the database through LoreDMS32 module with permission of the software owner.

<sup>7</sup> PRNet Halkla İlişkiler Araştırma ve Değerlendirme Hiz. AŞ, Büyükdere Cd. Meydan Sk. Spring Giz Plaza B Blok, No: 17-18 Maslak İstanbul (+90) 212 328 18 09 <http://www.pnet.com.tr>

Following the data controlling through LoreTools, tabulation was done with LoreDAS which are modules of this software (Delahaye Medialink, 1997).

Through the selected newspapers which are *Posta*, *Hürriyet*, *Sabah*, *Zaman*, *Cumhuriyet*, *Ortadoğu* and *Özgür Gündem*, all news/articles were searched via Mediaprof.Net web portal. PRNet clips all foreign and domestic newspapers and magazines using Dalian software, and this database is serviced through Mediaprof.Net web portal. Each news / article was read through scanned original clips and certain data like the width and height of each clip were taken from the web. Some other criteria needed for the analyses were also formulated and transferred to the software program. The News/Columns included in the thesis were all analyzed quantitatively and qualitatively with the communication research methods of Delahaye Medialink USA Inc.<sup>8</sup>

Quantitative analyses of the study were:

1. Date of the news
2. Newspaper's name (main body or supplements.)
3. Title of the news
4. Source of the news (Writer, Media News Agency)
5. Dimension: the area of the news clips in terms of centimeters and columns
6. The page number of the news
7. Type of the news (news, article, column, etc.)

The selected news/columns were examined as text analyses that are oriented towards deciphering the messages given to the readers.

The qualitative analysis was made by reading the news/columns and was included classification of the news through the content analyses.

---

<sup>8</sup> Delahaye Medialink USA, 800 Connecticut Avenue, First Flor, West Wing Norwalk, CT 06854 USA, (+00) 203 899 1600, <http://www.delahaye.com>

Criteria for qualitative analyses of the study were:

1. The dominance of the issue in the news as exclusive for the studied subject, dominant, equal or briefly mentioned.
2. Subject of the examined news/column: The equivalent of the main subject of the news/article in the subject matrix classification. The main subjects of the “Family Planning” media reflection in the matrix are as follows: Contraceptive Methods, Woman Health, Inventions in Medicine, Researches, General Health Issues, Population, Sexual Health, NGO Issues etc.
3. Sub-Subject: The subdivisions special to the platform of the examined elements categorized to provide a better understanding of the “Subject.” This was especially used for the “Contraceptive methods” news/columns for discovering which type of method was reflected in the media.
4. Approach of the news/articles towards the issue as positive, negative or neutral mention.
5. Use of visual materials (pictures of women, child, health personnel, contraceptive depictions)
6. Quotation Analysis: It was examined whether the people who are quoted in the news/columns, readers’ perception - of the quoted people’s statements relating to the analyzed elements, the title of the quoted person or the type of his/her relationship with the analyzed element, and a grouping was examined by quoting people so as to make a general evaluation possible.

## 4.2. Content Analysis Method

Content analysis has been defined as a systematic, replicable technique for compressing many words of text into fewer content categories based on explicit rules of coding (Weber, 1990). Holsti (1969) offers a broad definition of content analysis as, "any technique for making inferences by objectively and systematically identifying specified characteristics of messages" (p. 14). Under Holsti's definition, the technique of content analysis is not restricted to the domain of textual analysis, but may be applied to other areas such as coding student drawings, or coding of actions observed in videotaped studies. In order to allow for replication, however, the technique can only be applied to data that are durable in nature (Stemler, 2001)

Content analysis enables researchers to shift through large volumes of data with relative ease in a systematic fashion. It can be a useful technique for allowing us to discover and describe the focus of individual, group, institutional, or social attention (Weber, 1990). It also allows inferences to be made which can then be corroborated using other methods of data collection. Krippendorff (1980) notes that "[m]uch content analysis research is motivated by the search for techniques to infer from symbolic data what would be either too costly, no longer possible, or too obtrusive by the use of other techniques" (p. 51) (cited in: Stemler, 2001).

Perhaps the most common notion in qualitative research is that a content analysis simply means doing a word-frequency count. The assumption made is that the words that are mentioned most often are the words that reflect the greatest concerns. While this may be true in some cases, there are several counterpoints to consider when using simple word frequency counts to make inferences about matters of importance (Stemler, 2001)

Content analysis extends far beyond simple word counts, however. What makes the technique particularly rich and meaningful is its reliance on coding and categorizing of the data. The basics of categorizing can be summed up in these quotes: "A category is a group of words with similar meaning or connotations" (Weber, 1990, p. 37). Categories must be mutually exclusive and exhaustive. Mutually exclusive

categories exist when no unit falls between two data points, and each unit is represented by only one data point. The requirement of exhaustive categories is met when the data language represents all recording units without exception. (Stemler, 2001)

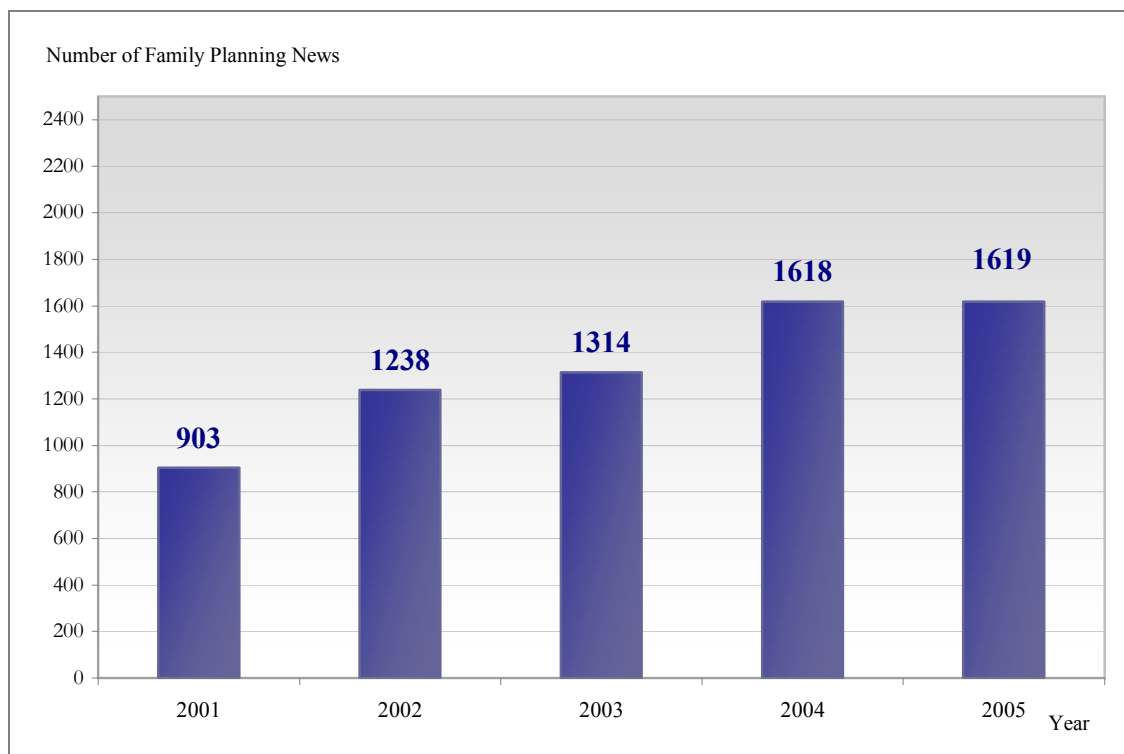

In this study, news/columns were categorized according to their subjects such as NGO news and news mentioning contraceptive methods. Besides, the dominance of the family planning or birth control issue within each news/column, the approach or language of the newspaper towards the issue presenting as negative, neutral and positive were coding and categorizing methods of the study. So, this would allow the researcher to group many news into some basic categories and to summarize the database.

## 5. ANALYSES

### 5.1. General Approach to The Family Planning News in Turkish Media

6692 news were determined with the keyword “*Family Planning | Birth Control*” between 2001 and 2005 in all national newspapers<sup>9</sup>. There is a clear increase in the frequency of news within these years. The most frequently published news are found in year 2005 with 1619 news. With 477 news, *Posta* has the first place in the number of news, which is followed by *Hürriyet* (450 news) and *Sabah* (445 news).

**Figure 5.1** *The Number of Family Planning News in Turkish Dailies by Year (2001-2005)*

<sup>9</sup> Akşam, Birgün, Bugün, Cumhuriyet, D.B. Tercüman, Dünya, Fanatik, Gözcü, Güneş, Günlük Evrensel, H.O. Tercüman, Hürriyet, Hürses, Milli Gazete, Milliyet, Ortadoğu, Pas Fotomaç, Posta, Radikal, Referans, Sabah, Star, Takvim, The New Anatolian, Turkish Daily News, Türkiye, Vakit, Vatan, Yeni Asya, Yeni Mesaj, Yeni Şafak, Yeniçağ, Zaman, Özgür Gündem, Şok, Yeni Binyıl, Akit, Habertürk, Yarın, Finansal Forum.

The increase can be explained with the increase in the number of the news of the projects started to be implemented in Turkey concerning family planning.

Some of the major projects introduced to be implemented by the year 2004 are:

- Turkish Armed Force's reproductive health and family planning trainings for 500 thousands soldiers
- EU Commissions' 7.2 million support for 27 projects an reproductive health and family planning.

In addition to those projects, Hacettepe University Institute of Population Studies (HUIPS)'s announcement of the results of 2003 Turkey Demographic and Health Survey has also affected the number of news.

Some of the major projects began to be implemented by the year 2005 are:

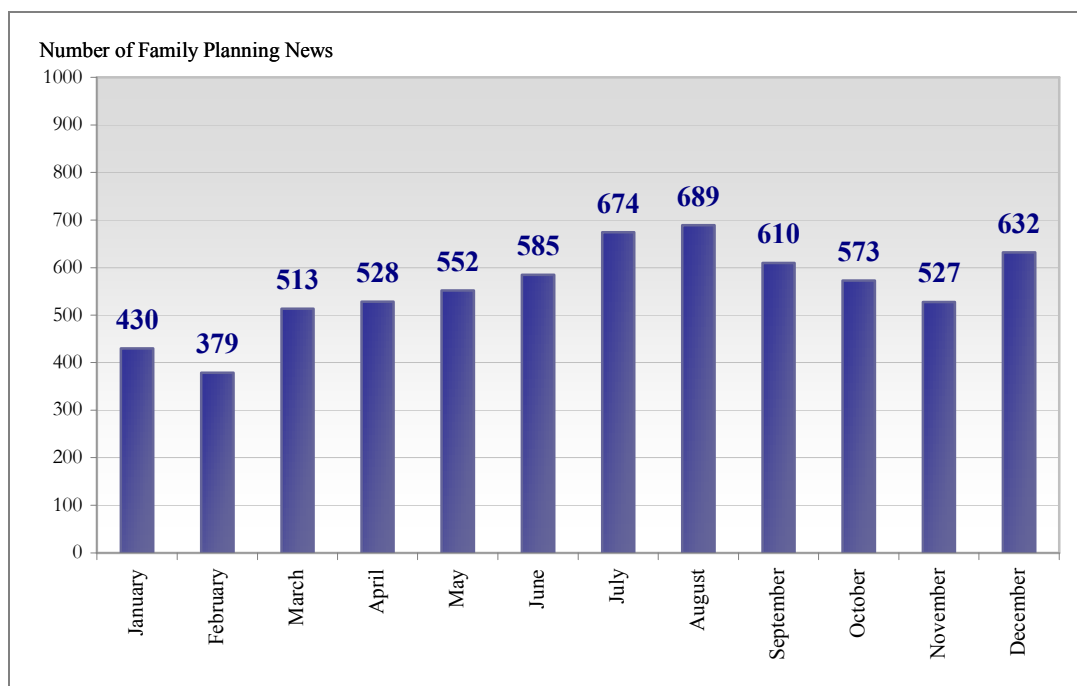

- Turkish Pharmacists' Association-EU project
- Family Planning Association of Turkey (FPAT) projects
- Local projects conducted in the East and the Southeast provinces
- Mother and Child Health and Family Planning Department of the Health Ministry (MCH/FP)'s data and facility announcements

**Figure 5.2 The Number of Family Planning News by Months (2001-2005)**

When we look at monthly distribution of “family planning” news/columns, there is an increase trend in July and August months. As to understand the underlying factors behind the increasing number of family planning news, the monthly number of news associated with the three leading conglomerates, namely *Sabancı*, *Koç* and *Eczacıbaşı* was analyzed for 2004<sup>10</sup> and 2005<sup>11</sup>. These analyses were obtained through the source of Mediaprof® media monitoring database of PRNet Inc. It is

10

2004		Months											
Holding Company	January	February	March	April	May	June	July	August	September	October	November	December	Total
SABANCI	425	512	556	1608	679	687	542	319	603	788	667	666	8.052

<b>Total</b>	<b>1565</b>	<b>1413</b>	<b>1336</b>	<b>1787</b>	<b>1956</b>	<b>1794</b>	<b>1361</b>	<b>1365</b>	<b>2537</b>	<b>2441</b>	<b>2057</b>	<b>2721</b>	<b>22333</b>

observed that the number of news related with these three conglomerates decreases significantly in summer, especially in July and August. This observation may be explained with the declining number of news from finance sector due to slowing economic activity. From this perspective, the increasing number of family planning news in summertime may be explained as the newspapers cover family planning news more frequently to fill up the space in these periods when the number of news declines.

## 5.2. Analysis of “Family Planning” News/Columns within Selected Newspapers Included to the Sample

Table gives cumulative number of news/columns over selected 7 newspapers and the whole number of news/columns for 5 years period. The number of news/articles containing “*Family Planning | Birth Control*” keywords is 2139 within the 7 newspapers limitation. All of these news/articles were read, analyzed and transferred to database.

**Table 5.2** *The Number of Family Planning News by Selected Newspaper (2001-2005)*

## 5.2.1. Quantitative Analysis in News

### 5.2.1.1. Number of News / Columns by Years and Newspapers

After choosing all news/columns that were published in selected newspapers, some news/articles were determined as irrelevant for the study. Giving an example to such an irrelevant news is: Mother and Child Health and Family Planning Department of the Health Ministry (MCH/FP)'s facility news which are about infant deaths. MCH/FP's iodine usage in children are other examples of irrelevant news/articles. Other examples of this kind of news may be those relating to the literacy courses or woman-oriented projects apart from family planning organized by the Turkish Family Health and Planning Foundation (TFHP) or Family Planning Association of Turkey (FPAT). The number of irrelevant news/articles was 849 and these were excluded from the study and the number of relevant news/articles decreased to 1.290. The ratio of this elimination is 39.7 percent.

*Figure 5.3 The Number of Family Planning News/Columns by Selected Newspaper (2001-2005)*

*Posta* is at the top in publishing “Family Planning” news/columns with 324 within the 7 national newspapers and *Zaman* has the least number of news/ columns. *Posta* is followed by *Hürriyet* (269 news) and *Sabah* (228 news).

**Table 5.3** *The Number of Family Planning News by Newspaper According to Years (2001-2005)*

NEWSPAPER	YEAR					Total # of Family Planning News
	2001	2002	2003	2004	2005	
POSTA	33	64	38	70	119	324
HÜRRİYET	38	46	36	77	72	269
SABAH	33	36	40	60	59	228
ORTADOĞU	28	24	16	33	23	124
ÖZGÜR GÜNDEM	NA	10	24	45	41	120
CUMHURİYET	29	45	19	35	34	162
ZAMAN	7	18	6	13	19	63
<b>TOTAL</b>	<b>168</b>	<b>243</b>	<b>179</b>	<b>333</b>	<b>367</b>	<b>1290</b>

NA: Newspaper not being published at that year

When the distribution of the news/columns by years is read, newspapers which are at the top in publishing the news/columns about family planning issues are *Hürriyet* in 2001 and 2004 with 28 and 77, *Sabah* in 2003 with 40. The other years, *Posta* was at the top in publishing “Family Planning” news/columns (2002:64 and 2005:119). There is a significant increase in the number of news/columns published by *Posta* newspaper especially in 2005. The main reason for this increase may be the columns of *Dr. Mustafa Bahçeci*, *Ass. Prof. Teoman Kadioğlu* and *Dr. Haydar Dümen* namely “Gynecologist Prof. Dr. Mustafa Bahçeci Answers Your Questions on gynecological diseases”, “Sequal Life with Questions” and “Dr. Haydar Dümen Answers Your Questions on Sexuality” which did not exist before 2005. These columns especially answer readers’ questions on modern family planning methods. *Ortadoğu* newspaper remains stable through years. *Cumhuriyet* newspaper reflects a difference by years,

but the number of news/columns in the last two years is almost equal. A significant increase is observed in *Özgür Gündem* newspaper especially in 2004 and 2005, which is mainly due to the increase in the news reports relating to the family planning projects in the eastern and southeastern region. To exemplify this kind of news, we may cite “Campaign in Siverek for Bearing Children As Much As You Can Care” (*Özgür Gündem*, 3.08.2004), “Service to New Neighbourhoods of Bağlar” (*Özgür Gündem*, 23.08.2005), “Life in Viranşehir” (*Özgür Gündem*, 17.02.2005), “Women Projects are Realized” (*Özgür Gündem*, 12.03.2005), “Health Training to Women in Siirt” (*Özgür Gündem*, 10.04.2005) (See Appendix I).

**Table 5.4** *The Number of Family Planning News / Columns by the Placement in the Newspaper (2001-2005)*

NEWSPAPERS	Main Body of the Newspaper	Supplements of the Newspaper	TOTAL
POSTA	316	8	324
HÜRRİYET	112	157	269
SABAH	95	133	228
ORTADOĞU	121	3	124
ÖZGÜR GÜNDEM	120	NA*	120
CUMHURİYET	123	39	162
ZAMAN	61	2	63
<b>TOTAL</b>	<b>948</b>	<b>342</b>	<b>1290</b>

\* NA : There is no supplement of *Özgür Gündem*

When the part of the newspaper the news takes place is analyzed, it is seen that 73.5 % of the news were published in the main body of the newspaper, whereas the 26.5 percent was published in the supplements. Especially in *Hürriyet* and *Sabah*, the greatest part of the news are not published in the main part of the newspaper. The supplements of *Sabah*, namely *Sabah Sağlık ve Cinsellik*, *Sabah Günaydın* and *Sabah Pazar*, cover much news on the issue. In the same way, the supplements of *Hürriyet*, namely *Hürriyet Kelebek*, *Hürriyet Bilim*, *Hürriyet Cumartesi* also present

news on family planning issues often. It has been seen that *Cumhuriyet* presented 24.1 percent of related news on *Cumhuriyet Magazine* and *Cumhuriyet Bilim* supplements.

### 5.2.1.2. Number of News / Columns by Dimension

An analysis that enables a relative expression of the physical size of the news is presented in this part. Dimension is not a metric measurement. Dimension evaluation of two metrically same news/articles may vary between newspaper and magazine. This is because of the difference in the page size of newspaper and magazine. The size of the other news in the same page is also effective in the dimension evaluation. In this analysis, New / Columns have been categorized as small, average, large by multiplying column and centimeter. Intervals are small (0-59 column x centimeter), average (60-119 column x centimeter) and large (120 and over column x centimeter). Scales were taken from PRNet's analyzing methodology.

**Table 5.5** *The Number of The News / Columns by Dimension (2001-2005)*

DIMENSION	NUMBER OF NEWS / COLUMNS	
	N	%
LARGE	733	56.8
AVERAGE	225	17.4
SMALL	332	25.7
<b>TOTAL</b>	<b>1290</b>	<b>100.0</b>

In dimension analysis of the news/columns, the picture is that 56.8 percent of the news/columns are categorized as large, 17.4 percent are average and 25.7 percent are small. When we look at the dimension of the family planning news in the selected newspapers, a majority of the news/columns are observed to be large news. Since the use of visual materials is one of the most important factors affecting the size of the

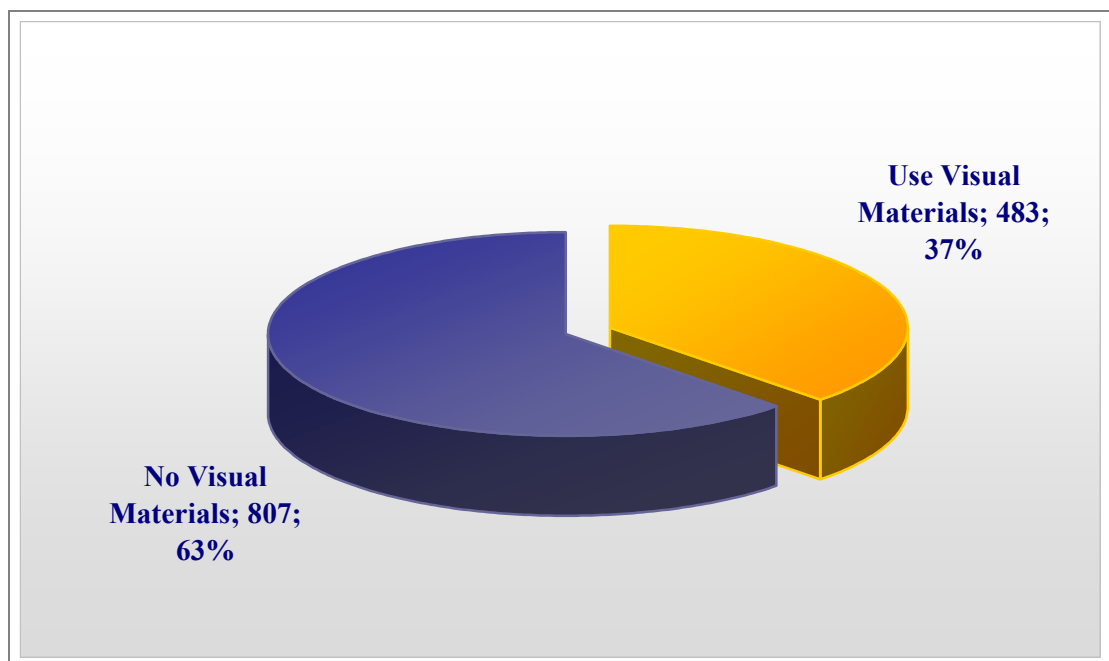

news, most of the news/columns using visual materials have been categorized as large news.

### 5.2.1.3. Visual Materials by Newspapers

Visual materials were used in 483 of 1290 news/columns (37.0 percent) and the quantity is the highest in *Posta* (50.0 percent). *Zaman*, having photos only 17.5 percent of its news/columns, preferred to no use of visual materials.

**Figure 5.4** Use of Visual Materials by Number of Clips (2001-2005)

**Table 5.6 The Number of Visual Materials Used by Selected Newspaper (2001-2005)**

NEWSPAPERS	Use Visual Materials %	No Visual Materials %	Total (%)	Total # of FP News
POSTA	50.0	50.0	100.0	324
HÜRRİYET	31.6	68.4	100.0	269
SABAH	43.0	57.0	100.0	228
ORTADOĞU	27.4	72.6	100.0	124
ÖZGÜR GÜNDEM	30.0	70.0	100.0	120
CUMHURİYET	19.1	80.9	100.0	162
ZAMAN	17.5	82.5	100.0	63
<b>TOTAL</b>	<b>35,4</b>	<b>64.6</b>	<b>100.0</b>	<b>1290</b>

**Table 5.7 The Number of Visual Materials Used by Type of Selected Newspaper**

NEWSPAPERS	Posta	Hürriyet	Sabah	Ortadoğu	Özgür Gündem	Cumhuriyet	Zaman	Total	Total (%)
Women	7	34	18	25	48	46	3	181	37,5

Illustration / Comics	4	6	2	0	31	9	0	52	10,8
Children / Baby	8	4	4	4	7	5	2	34	7,0
Men	3	10	3	0	7	6	3	32	6,6
Contraceptive Method	1	12	0	0	6	6	0	25	5,2
Women & Children	0	1	2	4	10	4	2	23	4,8
Doctor	2	1	1	1	6	4	1	16	3,3
A Group of People	2	4	0	1	1	0	0	8	1,7
Animal	1	3	0	0	2	0	0	6	1,2
Family (Mother & Father and Child)	0	1	1	0	2	2	0	6	1,2
Medicine	0	1	1	1	1	1	0	5	1,0
Other	3	8	8	1	4	2	0	26	5,4
<b>TOTAL</b>	<b>34</b>	<b>93</b>	<b>42</b>	<b>37</b>	<b>166</b>	<b>100</b>	<b>11</b>	<b>483</b>	<b>100.0</b>

One of the interesting findings was the abundantly use of women photo as the visual materials in the examined news/columns. In the visual material analysis in the examined news/columns, it is clearly seen that Women-Men & Women photos have the proportion of 51.8 percent. Out of women pictures, 33 of them may be categorized as naked woman, 14 as pregnant woman and 13 ill woman in bed. Besides, there were 69 man & woman photos, most of them were nude and photos of happy couples. Adversely, the proportion of contraceptive method photos is only 5.5 percent.

During the analysis of the news about family planning, news about family planning regarding the animals have been come across and these news have used animal pictures as visual aids. Pictures of the animal relating to the news have been used as visual aids in news such as “Feeds with birth control pills for pigeons” (*Hürriyet*, 24.06.2003), “Birth control pill for male cattle” (*Hürriyet*, 24.11.2003), “This pill for this size” (*Posta*, 24.08.2004) (See Appendix I). This can be interpreted as the reflection of Turkish media’s popular line about a health issue which is “birth control”.

## **5.2.2. Qualitative Analyses in News**

### **5.2.2.1. Approach by Number of News / Columns and Circulation**

The news/columns which have the reader get a “positive”, “neutral” or “negative” image of the examined element a family planning issues.

**Table 5.8 Approach by Number of News / Columns in Selected Newspaper (2001-2005)**

Approach	NUMBER OF NEWS / COLUMNS	
	n	%
POSITIVE	483	37.4
NEGATIVE	243	18.9
NEUTRAL	564	43.7
<b>TOTAL</b>	<b>1290</b>	<b>100.0</b>

News evaluated as positive informs the readers about family planning accurately and correctly, encourage the reader about the issue and emphasize the importance of family planning. “Women started to like implant,, (*Cumhuriyet*, 26.12.2004), “Birth control does not make you infertile,, (*Hürriyet*, 16.05.2001), “Both effective and comfortable,, (*Posta*, 23.12.2005), “Future will be very healthy,, (*Posta*, 24.06.2004), “We are to strengthen family planning,, (*Zaman*, 9.11.2003), “Don’t be ashamed, be informed,, (*Posta*, 3.06.2002), “Birth control is a must during breast feeding period,, (*Özgür Gündem*, 9.11.2003), “Birth control pill is not known enough,, (*Ortadoğu*, 07.01.2004), “Women loved this T,, (*Sabah Cumartesi*, 11.06.2005) can be shown as examples (See Appendix I).

If the news in newspapers creates a negative effect regarding family planning concept or modern family planning methods in the readers, they have been evaluating as news in negative category. News such as “Low population does not have advantages,, (*Ortadoğu*, 28.12.2002), “Destiny of Turks,, (*Ortadoğu*, 5.5.2003), “Is it religiously permissible to abort handicapped child and infertilize the mother? ,, (*Zaman*, 18.08.2005), “National Security Council’s fear of Kurdish population,, (*Özgür Gündem*, 02.09.2005), “Birth control pills increase cancer risk,, (*Sabah*, 05.04.2003) can be shown as examples (See Appendix I).

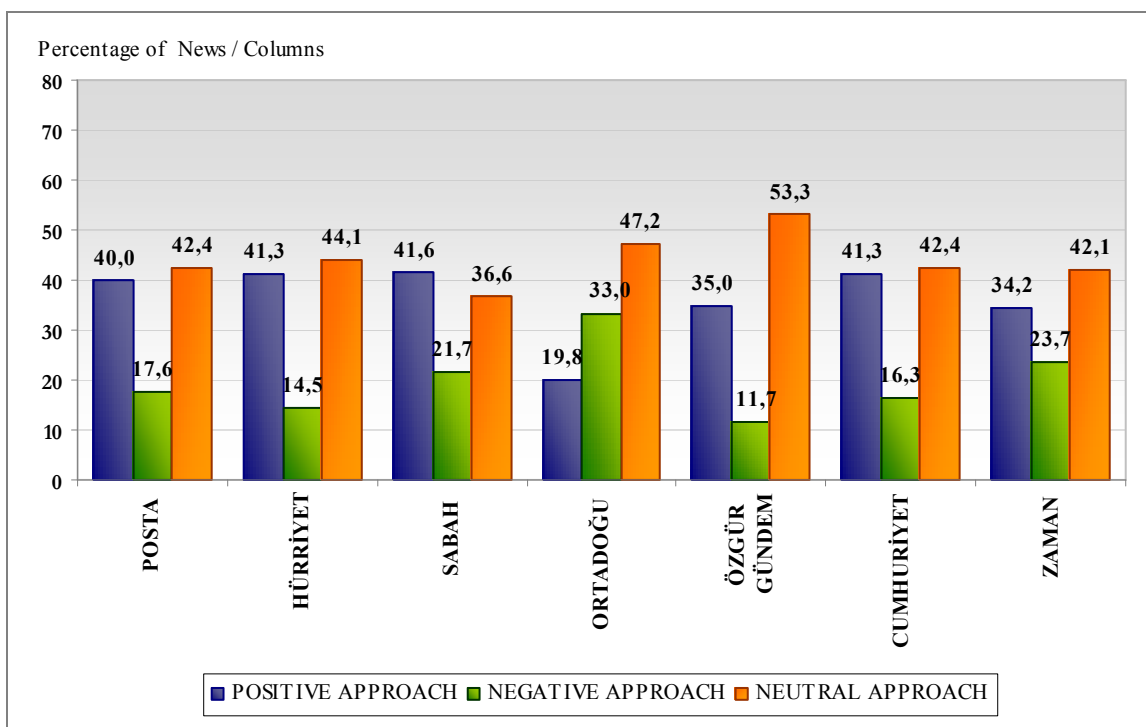

The news under objective news category are the ones giving usually the research results or civil society projects without making any positive or negative comments.

In general, the results are shared with the readers in these news and no comments are made.

**Table 5.9** *Approach by Years of News / Columns in Selected Newspaper (2001-2005)*

NEWSPAPERS	APPROACH			TOTAL
	POSITIVE	NEGATIVE	NEUTRAL	
POSTA	130	57	137	324
HÜRRİYET	103	36	110	249

**Figure 5.5** *Percent Distribution of News / Columns According to Approach by Type of Newspaper (2001-2005)*

Looking into the graphic above, it stands out that among the 7 selected newspapers, the positive news are most placed in *Sabah* newspaper with at least one difference (41.6 percent). *Ortadoğu* newspaper has the first rank in terms of negative news (33.0 percent).

*Ortadoğu* newspaper, in accordance with its ideology, reacts negatively towards family planning among Turks while following an understanding of journalism which supports the studies conducted about family planning in Eastern region of Turkey. For instance, in the news headlined “The Destiny of Turks” which was published on 5th May 2003, it is clearly highlighted that the aim of family planning was to decrease the population of Turkish nation. Again in the news headlined “Where can you find Henna from?” by *Altemur Kılıç* which was published on 6th September 2005, they have clearly shown their approach on the issue using the expression – while the Kurds are multiplying, Turks are using contraceptive methods. However, it is seen that the *Ortadoğu* newspaper is bearing a positive approach towards the family planning studies conducted in Eastern and South-eastern cities and that there are positive reflections in the newspaper about the issue. “Family Planning from the female senior lieutenant in Tatvan” (*Ortadoğu*, 29.12.2001), “Turkish soldiers scatter peace” (*Ortadoğu*, 14.01.2001), “Turkish soldier is at work anywhere” (*Ortadoğu*, 13.11.2001) As can be inferred from the news headlines above, especially the services such as informing and education on family planning has always been reacted positively by the newspaper (See Appendix I).

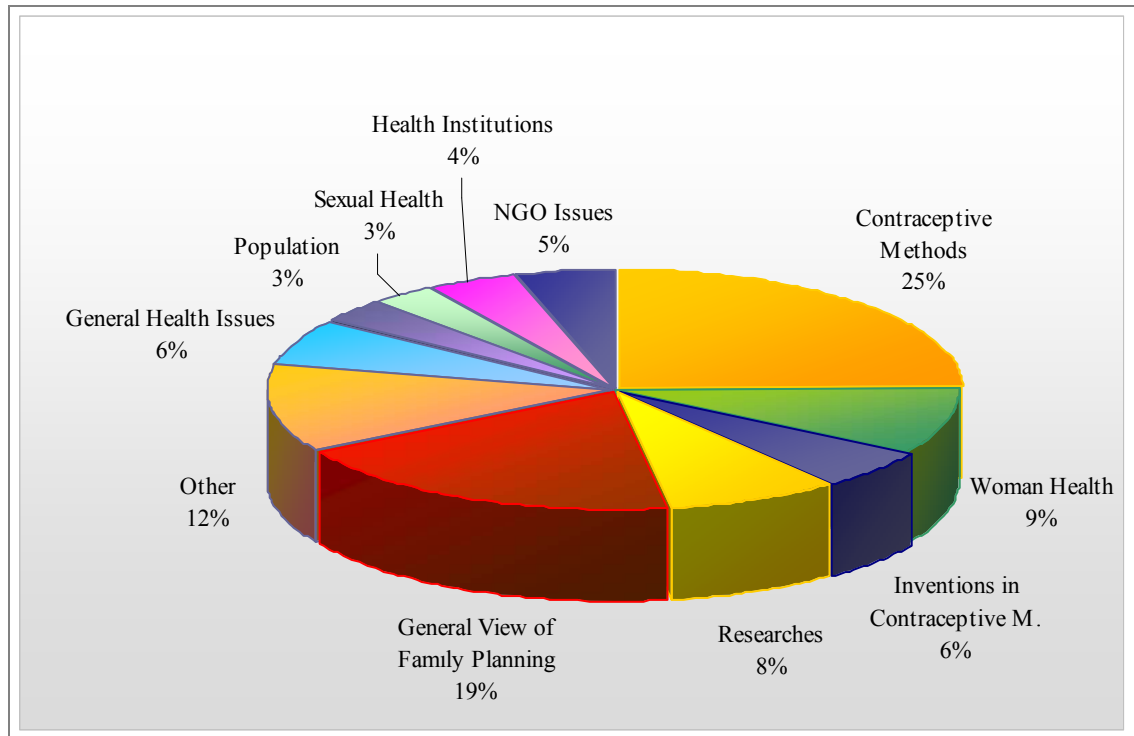

*Zaman* newspaper takes the second rank in terms of negative news (23.7 percent). The approach of the newspaper especially on tubeligation and abortion are clearly revealed in the news. In the news such as “Speech on contraception in Moral FM” (*Zaman*, 24.03.03), “Is it religiously permissible to abort disabled child and infertilize the mother?” (*Zaman*, 18.08.2005), it is clearly stated that tubeligation is not religiously proper. In the news report headlined “The women have the fear that the doctor may say a bad thing” (*Zaman*, 18.01.2002) it is in short stated that the long-term usage of birth control pills are harmful and it is also stressed that tubeligation must not be seen as a contraceptive method (See Appendix I).

Another newspaper in which there are negative reflections of tubeligation is *Özgür Gündem*. In the news reports such as “The sterilization behind the scenes” (*Özgür Gündem*, 24.11.2002), “Sterilization in German press” (*Özgür Gündem*, 24.11.2002), “Monetary rewards for sterilized women!” (*Özgür Gündem*, 22.08.2003), “Sterilization is a public violence” (*Özgür Gündem*, 19.11.2002), “Cord scandal in SSK” (*Özgür Gündem*, 13.12.2004) it is emphasized that the women were sterilized by force in such regions as southern east and east in order to control the growth of population. However, *Özgür Gündem* newspaper is drawing attention with its neutral and generally positive approach towards the modern family planning methods except for tubeligation and vasectomy. The following news can be given as an example for this: “Birth control is a must in breast feeding period.” (*Özgür Gündem*, 8.12.2004), “Make children only as many as you can look after campaign in Siverek” (*Özgür Gündem*, 3.08.2004) “Birth control pills are healthiest” (*Özgür Gündem*, 3.05.2004) (See Appendix I).

#### **5.2.2.2. Subject by Newspapers (Number of the News / Columns)**

The 1290 news reports of the selected newspapers are categorized according to the topic of the news. The subject analysis showed that 25 percent of the news/columns is about contraceptive methods. This is followed by news in which the general view on family planning is included. (19 percent) In the distribution the researches on family planning take a ratio (8 percent) and there are also the projects about the issue conducted by NGO’s in this distribution (5 percent).

**Figure 5.6** *Subject by Number of News / Columns by Selected Newspaper (2001-2005)*

Besides, the ratio of the news/columns concerning inventions in contraceptive methods is 6 percent. Tılıç and Kuru (2004) made considerable assignments in their paper named “A Minefield in Turkish Media: Health News”. According to Tılıç and Kuru, journalists of Turkish media find only “fantastic-interesting-miracle” news being oriented by editors and the media groups. For this reason, “new scientific invention”, attractiveness, sensations are the axis of health news. Not considering damage- efficacy of these kind of news, creates a notion of “medicine paparazzi”.

**Table 5.10** *The Number of Contraceptive Methods News / Columns by Sub-Subject (2001-2005)*

<b>Contraceptive Methods Subject</b>	<b>N</b>	<b>%</b>
Pill	150	47.0
Mixed Contraceptive Methods	58	18.0
Condom	25	7.7
Emergency Contraception	19	6.0
IUD	16	4.9
Contraceptive Patch	11	3.3
Implant	11	3.3
Tube ligation	7	2.2
Vasectomy	7	2.2
Traditional	5	1.6
Injectable	5	1.6
Female Condom	5	1.6
Cervical Circle	2	0.5
<b>TOTAL</b>	<b>321</b>	<b>100.0</b>

The subject of the published news is analysed in those newspapers and it is found that the news are mostly on contraceptive methods with a strong representation of oral contraceptives. Next, the greatest category after “specific contraceptive methods” is news giving information on “contraceptive methods in general”.

**Table 5.11 Approach by News / Columns about Contraceptive Methods Subjects by Newspaper (2001-2005)**

Contraceptive Methods Subject	Positive %	Negative %	Neutral %	Total %	Total # of News
Pill	54.7	29.1	16.3	100.0	150
Mixed Contraceptive Methods	42.4	12.1	45.5	100.0	58
Condom	50.0	0	50.0	100.0	25
Emergency Contraception	81.8	0	18.2	100.0	19
IUD	55.6	22.2	22.2	100.0	16
Contraceptive Patch	50.0	33.3	16.7	100.0	11
Implant	66.7	0	33.3	100.0	11
Tube ligation	75.0	25.0	0	100.0	7
Vasectomy	50	25.0	25	100.0	7
Traditional	0	0	100.0	100.0	5
Injectable	66.7	0	33.3	100.0	5
Female Condom	100.0	0	0	100.0	5
Cervical Circle	0	0	100.0	100.0	2
<b>TOTAL</b>	<b>54.1</b>	<b>19.1</b>	<b>26.8</b>	<b>100.0</b>	<b>320</b>

A noteworthy outcome of the study is that 29.1 percent of news on oral contraceptives have a negative attitude on pills. “Oral Contraceptives decrease the sexual desire” (*Hürriyet*, 10.06.2005), “Oral Contraceptives decrease the smelling capability” (*Sabah Cumartesi*, 27.10.2001), “Be careful with the Oral Contraceptives” (*Hürriyet*, 10.08.2005), “Oral Contraceptives decrease the desire for sex” (*Cumhuriyet Bilim Teknik*, 18.6.2005), “Oral Contraceptives cause cancer” (*Sabah*, 9.01.2001), “Oral Contraceptives trigger cancer” (*Hürriyet Bilim*, 15.03.2003), “Oral contraceptives increase the risk of cancer” (*Sabah*, 5.4.2003) are among the news reflecting this negative attitude towards the pills (See Appendix I).

Surprisingly, the news with a positive view on oral contraceptives is in the opposite direction. It is also interesting to note that the positive news are also published in the above mentioned newspapers and their supplements. For example, “Oral

Contraceptives do not cause cancer” (*Sabah Günaydın*, 6.1.2004), “Oral contraceptives protect from heart attack” (*Hürriyet*, 23.10.2004), “Oral contraceptives protect from cancer” (*Hürriyet Bilim*, 24.08.2002) are among such news (See Appendix I).

### 5.2.2.3. Source of News / Columns

When the source of the news is examined, it is observed that 47.3 percent of the news do not give information regarding their source of the news. In health and medical news, it is very important to state the source. Especially when a new event or information is presented, the identity of the writer and the source should be open and clear. In fact, signed news with specified sources are a sine qua non in all areas, not just in health and medicine. However health and medicine is a matter to be more careful with regard to its results.

**Table 5.12** *Source of News / Columns by Number of Clips (2001-2005)*

SOURCE OF NEWS	# of News / Columns	%
Anatolia Agency (AA)	67	5.2
Doğan News Agency (DHA)	5	0.4
Dicle News Agency (DİHA)	34	2.6
Anka News Agency (ANKA)	2	0.2
Bianet Online Independent Communication Network (BİA)	36	2.8
AUTHOR	536	41.6
UNKNOWN	610	47.3
<b>TOTAL</b>	<b>1290</b>	<b>100.0</b>

Among the news with the name of the writers given, the news are generally from *Dr. Mustafa Bahçeci* from *Posta*, *Dr. Gündüz Tezmen* and *Mesude Erşan* from *Hürriyet*. Reader’s Columns hold the first place in including questions about family planning. *Güzin Abla* Reader’s Letters, part of the *Hürriyet* newspaper, includes

various questions such as “Is it enough for protection?” (*Hürriyet*, 7.09.2001), Is birth control a sin? (*Hürriyet*, 23.07.2002), “How much can I trust birth control pill? (*Hürriyet*, 2.04.2003), Did we go too far? (*Hürriyet*, 23.01.2001), I’m scared to be a mother (*Hürriyet*, 17.05.2003) from the readers (See Appendix I).

In most of the *Ortadoğu* newspaper news, the name of the author is not given. *Özgür Gündem* newspaper, on the other hand, uses Dicle News Agency (DİHA) and Bianet Online Independent Communication Network (BİA). AA (Anatolian Agency) is among the source of the news of the newspapers other than *Ortadoğu* and *Özgür Gündem*. Another news source used especially by *Posta* and *Hürriyet* is DHA (Doğan News Agency). *Cumhuriyet* and *Özgür Gündem* are the ones who primarily to use ANKA news.

#### 5.2.2.4. Quotation Analysis of News / Columns

When we take a look at the quotation analysis, it is seen that there are quotations in 236 of 1290 news (19.5 percent ).

**Table 5.13 Quotation Analysis of News / Columns by Approach (2001-2005)**

QUOTATION TYPE	QUOTATION APPROACH			
	POSITIVE	NEGATIVE	NEUTRAL	TOTAL
DOCTOR & PROFESSOR	101	40	59	199
BUREAUCRAT	13	11	5	29
OTHER	3	5	0	8
<b>TOTAL</b>	<b>117</b>	<b>56</b>	<b>64</b>	<b>236</b>

Considering that most of them are “Doctors & Professors”, i.e. experts from the medical sciences, we can mention suggestions of Tılıç and Kuru (2004) concerning this point. Tılıç and Kuru (2004) underline the necessity of including health reporting as a mandatory class in communication faculties, putting forward the argument that

health reporting should be made by professional reporters on the basis of their relations with people and institutions professional in medical sciences.

## 6. CONCLUSION

Focusing on the way of presentation of family planning related news in Turkish print media, this study has aimed to discuss the approach of the Turkish print media towards family planning issues through qualitative and quantitative analyses of the news/articles in the newspapers selected so as to represent the overall frame of the Turkish press. By way of adopting the method of content analysis, the study has also intended to highlight the ideological viewpoints of different newspapers, their arguments about and contributions to the issue of family planning. Since the literature review has not led us to any similar study concerned with the content analysis of family planning news, the findings achieved from this study gain even more importance.

Despite being approximately 4 millions daily, the circulation figure in Turkey is low compared to the European or other developed countries. In the case of Turkey, some of the holders of national daily newspapers are also managing national TV channels and are called as ‘media groups’. For instance, *Ciner Holding*, also known as *Merkez group*, is the holder of daily papers *Sabah*, *Takvim* and *Fotomaç* and at the same time this group is the owner of two television channels, namely *ATV* and *Kanal 1*. *Doğan Holding* is another and the biggest pioneer actor in the Turkish media with its big dailies *Hürriyet*, *Milliyet*, *Posta*, *Radikal*, *Fanatik* and with its television channel *Kanal D*. *Zaman* and *Samanyolu* TV belong to another media group (Doğan, 2005).

Because of media ownership and circulation figures of these newspapers, *Posta*, *Hürriyet* and *Sabah* were included to the research to uncover huge culverts’ voice. Besides media ownership and positions, *Cumhuriyet*, *Zaman*, *Özgür Gündem* and *Ortadoğu* were selected in order to analyse reflections of different views through media instruments. Time interval was determined as 2001-2005, accepting TDHS-2003 as the base, to see 5 years tendencies.

As a result of the searches made with the keywords “*Family Planning | Birth Control*”, 6.692 published news/columns were seen in the national daily print media during the 2001-2005 periods. The figure decreased to 2.139 news/columns for the same period and same search string when the newspapers that has been included in this study is considered. Examining each of these 2.139 news/columns, 39.7 percent, i.e. 849 of these were found to be irrelevant news/articles about the family planning or birth control keywords. The reason for irrelevance of these news/columns was that although the searched keywords were mentioned in these articles and thus found by the system, these were mentioned only briefly in these articles which did not actually include any information or data regarding the issue of Family Planning or Birth Control. For instance, the General Directorate of Maternal-Child Health and Family Planning is mentioned in the article, but the article may actually be pertaining to infant mortality or iodine deficiency in children. As a result, 1.290 news/articles were included in the tables and interpretations. Each news/column was examined both quantitatively and qualitatively combining with the publication information.

Concluding the findings, it should be displayed that there is an increase in 2004 and 2005 years and the correlation can be established with three facts that have coincided, In the first place TDHS-2003 results were announced in 2004, secondly the EU funded family planning projects were initiated in year 2004 and 2005 and thirdly Mother and Child Health and Family Planning Department of the Ministry of Health (MCH/FP)’s data and facilities were announced. These were some events observed in the examined newspapers and caused an increase in the number of the news/columns in 2004 and 2005 compared to the preceding years.

As for the periods in which the number of family planning news/columns increased between 2001 and 2005, it is observed that the highest frequency is in the months of July and August. The main reason for the increase in the family planning news in these months may be that the news relating to Turkey’s three biggest conglomerates *Koç*, *Sabancı* and *Eczacıbaşı* decreases in these months.

In this study, 1.290 news/columns are evaluated on the basis of their tone of voice: Positive, Negative and Neutral. News evaluated as positive informs the readers about family planning accurately and correctly, encourage the reader about the issue and emphasize the importance of family planning. It is revealed that 37.4 percent of family planning news in the selected newspapers were grouped in the positive news category and the highest number of positive news/columns about family planning appeared in *Sabah* newspaper with 41.6 percent. If the news in newspapers creates a negative effect regarding family planning concept or modern family planning methods in the readers, they have been evaluated as news in negative category. Among the selected newspapers, the highest number of negative news/columns about family planning appeared in *Ortadoğu* newspaper with 33.0 percent, followed by *Zaman* newspaper with 23.7 percent. *Özgür Gündem* has been observed to have published the least number of negative news about family planning with 11.7 percent. The news under neutral news category are the ones giving usually the research results or civil society projects without making any positive or negative comments. In general, the results are shared with the readers in these news and no comments are made. *Özgür Gündem* ranks the first among the newspapers with 53.3 percent in terms the number of neutral or news/columns.

In terms of presentation of family planning news, different newspapers follow different approaches. *Ortadoğu* Newspaper seems to support all sorts of family planning activities in the South-East Region of the country, whereas clearly rejects the activities targeting “Turks”. *Özgür Gündem*, on the other hand, considers tubeligation as sterilization and makes news opposed to that form of family planning. The other news on *Özgür Gündem* shows that the newspaper has no negative attitude towards the other contraceptive methods. Another newspaper reflecting a negative attitude towards tubeligation is *Zaman*. Several news of this newspaper mention tubeligation as religiously not permissible. *Cumhuriyet* is a newspaper with high number of news on NGOs activities as well as the outcomes of scientific researches. No apparent negative attitude is observed in *Cumhuriyet* towards family planning in general or towards any specific family planning method. As *Hürriyet*, *Posta* and *Sabah* generally obtain their news from the same agency, the same news are

published in these three newspapers on the same days. No clear attitude of the newspapers regarding family planning can be obtained from the news published. All these three newspapers publish news favouring oral contraceptives one day and publish news discrediting the same method on the other day. The attitude is only related with the content of the news obtained from the agency. Another topic of family planning issues in these three newspapers is “reputedly new innovations”, i.e. the so-called newly discovered or developed methods of family planning (Tılıç, 2004).

When compared with *Özgür Gündem*, *Ortadoğu*, *Zaman* and *Cumhuriyet*, *Posta*, *Hürriyet ve Sabah* show a different style in the presentation of family planning news. *Hürriyet* and *Sabah* generally publish family planning news on the supplements of the newspaper. *Posta*, *Hürriyet* and *Sabah* often use visual materials. In those three newspapers with higher numbers of news with visual materials, it is observed that the size of the news increase with the use of visual materials. One of the attractive finding was the use of women photographs as the visual materials in the examined news/columns. In the visual materials analysis in the examined news/columns, it is clearly seen that Women-Men & Women photos have a very high proportion and most of them are nude photos of happy couples and women themselves. Another interesting point is that even the news providing very detailed information about contraceptives include visual materials of the same type. The proportion of contraceptive method photos is only 5.5 percent among all news with visual materials.

The 1290 news/reports of the newspapers selected for making analysis are categorized according to the topic of news. Subject analysis showed that 25 percent of the news/columns is about contraceptive methods. The subject of the published news is analysed in those newspapers and it is found that the news are mostly on contraceptive methods with a strong representation of oral contraceptives. Next, the greatest category after “specific contraceptive methods” is news giving information on “contraceptive methods in general”. In this point, a noteworthy outcome of the

study is that 29.1 percent of news on oral contraceptives has a negative attitude on the pills.

Consequently, all these analyses reveal that different perspectives dominate the ways newspapers present family planning and related issues. While *Ortadoğu* newspaper opposes to all family planning initiatives oriented towards Turks, *Özgür Gündem* regards tubeligation method as sterilization of Kurdish population, but welcomes other modern family planning methods other than tubeligation. Islamic terminology stands out in the news-making language of *Zaman* newspaper and it is especially stressed that tubeligation method is not religiously permissible. It is observed that *Cumhuriyet* newspaper attaches more importance and allocates larger space to scientific studies and projects about family planning compared to other newspapers. On the other hand, high seller newspapers *Posta*, *Sabah*, *Hürriyet* do not follow a line and their news/articles vary in terms of the tone they use.. Although it is very important to state the source in journalism, significant percent of the news does not give information regarding source of the news. Lack of usage of sources is also problematic for the studied papers, this can lead to decrease in consistency. Turkish printed media's attitude towards "family planning" issue was popular oriented. There were many news about "male methods" and many of the news were including women photos some of them being either nude women or nude couple. Moreover, some of the photos used for the news are sometimes happen to be irrelevant photos . All media tend to give "negative" news when they announced issues like "contraceptive pills increase cancer risk". Besides, media gives some laboratory news which are not necessary for readers such as "birth control pills for dogs".
